

30.9.6.39 *Microtus* foot 39 gro. ♂ testis 11 m.m.

31.9.6.39 *Microtus* 182-68-20-40 gro. ♀ uterus with 3 x 2 embryos.

Individual embryo = 14 m.m in curled position. Entire group approx 1 gr m wt.

24.9.6.39 *Sorex* 115-43-13.5 gr ♀ uterus normal, suckling, skull only.

58.9.6.39 *Microtus* 136-48-19.6- ♂ 16 gro. testis 3.5 m.m. Fecal pellet equal 1 1/2 x 5 m.m

Made trip into cirque at 3:20 P.M in rain. Arrived at lower flat at 3:33. Limestone spring 3:45. 2nd switchback 3:59.

3rd switchback at 4:07 and brinks of cirque at 4:15 P.M. Up until now the trapping has been effected by weather. Now both weather and sheep. The entire trap line was so placed that it required the passing over of wet vegetation and shrubbery. This made the route very disagreeable due to the fact that one was thoroughly drenched with rain and the cold biting deeply.

Had brought along an ankle length sheep skin coat so that I could return in fair comfort. The sheep had generally set off many, and the rain many others so did not keep exact record for each trap as it would not be significant in the end. Will indicate only those traps with mammals or bait gone. Braved the weather tonight and made final setting. Plan on bringing in traps tomorrow.

Inspection of research area A-9-5-39 shortly after arrival.
