

400204-4 south of where State Road → starts up first dugway. The

second stop was made to examine stratigraphy of delta bank. While pausing here observed an interesting sky line silhouette and could not help but waste another film so as a result have picture no. 3-2-4-40. The panoramic can be used for comparing snow deposit on mountains from year to year. Find that the creek below is choked with vegetation and supports a great number of water forms as crustaceans etc. Otherwise surrounding still in a

3-2-4-40

typical winter appearance.

2-11-40

This afternoon drove up American Fork Canyon to forks and then up north fork to skiing area. Find snow not quite as deep as normal. On return followed along lake shore at Geneva. Lake entirely free of ice. Few ice files remain on edge. One lone Canadian Goose in field above bench, and 3 blocks from lake shore. 120 horned larks associated with it.

2-14-40

120 Bohemian Watwing at B.Y.U. Campus. Flying in flock.

2-16-40

Considerable snow lost three days. Clear today. Flock of W. Evening Grosbeaks in city.

2-25-40

made ski trip today up American Fork Canyon. Harry Chandler accompanied me on this trip. Left Provo at 5:00 A.M. and arrived

1-2-25-40

at the junction of the North Fork, Southfork of American Fork Canyon. ^{at 6:00 A.M.} Road in good condition the entire distance up the canyon. Found the moonlight spotting the entire mountain in a most impressive manner, particularly upon the west exposure of Timpanogas. Snow not as deep in canyon as of previous year but probably has more water content. Left car at junct.
