G. T. Towhee	3		
Jack rabbit		1	
T. Solitaire		1	
Cottontail			
Meadowlark			1
Erithizon			3
Ferruginous R. Leg			1

Examined a nest and 2 fresh eggs of the G. H. Owl on south side of ridge near research area C-4-7-40. Nest in juniper 10' high and constructed as usual. Bird facing n.w. and left upon being approached. Flew n.w. and soon out of site around corner of ridge. Flew low on hillside. Ferruginous flew about 1 block away. Eutamias (probably m. conss.) in main canyon below government spring. On return near clay beds noticed an interesting terrace face on ridge to south. Could be studied later. Noticed Mississippian bed dip east to perpendicular east of Truckville and north to nearly perpendicular at clay beds. Quite a jumbled up mess. Erosional remnants of lake mt. appear to carry across to Traverse range. Continued to Sebi & hence to Provo arriving in the evening. Sandhills were supposed to have been in field at Sebi but did not notice them on road to Cedar Valley. Have no record today of any Canyon jays in Truckville. Mr. Hutchings was visiting eagle nest in Graham pass at south extension of Lake Mountain.

4-10-40

Western Chipping sparrows and several Kinglets in evidence in Provo.

4-11-40

Lynn Hayward reports the Citellus armatus active at aspen grove. He examined a nest of the Citellus placed superficial with hole leading to surface directly below. Abandon Channel some 20' long. Nesting material highly impregnated with its parasites.
