

large. Beneath the raven nest tree found an area that had received excreta and pellets which could be raven or owl. Phrynosoma present. Started again at 1:50 and before arriving at Orrs ranch made several stops so did not keep check of time. Investigated again the Ferruginous nest that was inspected two days ago and which at that time held 1 young & 1 egg. Now it possesses 2 young. Little body at nest. Birds overhead & calling. On way to ranch observed more hawks & ravens in air. Arrived at spring at Orrs and after dinner left at 4:15. 9 raven together on fence posts at ranch. also one falcon flying over premises. A Audubon warbler in long poplar tree at spring south of the ranch.

On main road east of Orrs ranch at point where first jumpers are found <sup>(3-5-5-40)</sup> Dad took picture of the shoreline which seems to be controlling the jumper growth. This picture is so far superior than the one taken with the small camera here. See note of this area in first

part of report. <sup>3-5-5-40</sup> Car developed distemper for hills and was necessary to have John tow us up through Devils gap. Left them at Glaver and travelled north to Toelle to get new distributor parts & adjustments. The divide just north of Stockton is made up of a barrier bar of Bonneville age. Arrived at Prans at 11:40 P.M.
