

are held as a premium. The sunset as we ⁴⁰⁰⁹¹⁵⁻¹⁵⁶ left Lincoln Beach was a rich yellow without cloud outlines. On road south of Lincoln Beach found four snakes that had been run over by cars. The snakes occurred in pairs and near each other. The first two were found just below median caves on road and were within 150 of each other. One was a Blue racer measuring 3' long and the other a blow snake 2'4" long. Both recently killed as blow snake still retained a reflex. Some 1 1/2 mile south of Lincoln beach on east side of west mt and probably a 1/2 mile beyond first pair of snakes found two more a Blowsnake measuring 3' 2" and a Blue racer measuring 2 feet. They were several days old and both together. They could have been fighting or attracted when run over. The shore lines might indicate another present stage in receding of Lake Bonneville.

The present level of last 100 years has made another wave cut terrace in either basic rock or unconsolidated material which is just about as conspicuous as the other prominent terraces.

Can see to north on Traverse mountains still another level above Bonneville level, at least it is so pronounced that it would indicate another level regardless of how unlikely it would be.

The Bonneville level at mouth of Provo Canyon run up to meet the canyon entrance some 100 feet or so. above Bonneville height.

Utah Lake.

From foot hills east of Provo could see with 8x binoculars about 3,000 pelicans on north terminal of Lake Island. Wind blowing from the south and raising dust cloud several hundred feet from mud lake channel to north Provo river. Fishermen in 3 boats at point of station 9/12/40 and no pelicans could be seen as a result.

Utah Lake.

Spent last night at station as established on the 12th of same month. Very few birds flying or calling either late last night or early this morning as contrasted with previous mornings. Shortly after dawn found thunder clouds in sky with mountains east of Provo and Tompanogas mountain capped with a large flat bottomed cumulus type cloud. As I awakened found a mixed group of California and gulls and Caspian tern resting of shore line n.n.w of station. These birds probably arrived here at daybreak
