← At this point found nest of one piped egg measuring with calipers 2.52 x 1.72 and one runt egg which was congealed and slightly rattled measuring 2.12 x 1.50. Collected this set of one runt egg at 2-5-31-41

← This bird with normal dwarfed leg.

Observed that the gulls leave (at peripheral edge zone) about 30' ahead and are rather loathe to return to nests, while those in established or center of colony remain at nests until almost being stepped upon and then return to nests as soon as one has passed by.
