

420111-6
Larus delawarensis. Few.

Larus cornus brachyrhynchus brachyrhynchus. Reg. 4 birds.

Mergus merganser americanus: 3 birds feeding in open in lee of piling. In going away in flight they suggest a gadwall. Broadside flight and diving characteristic. At a great distance look like murrelet or goldeneye.

Goldfinch. Flock in sands. Sp. (?), probably green-back.

Pipilo maculatus oregonus. 13 single birds.

Falco sparverius sparverius. One bird. Did not recognize red on back so may be young. It lit in willow tree for about 2 minutes and then continued down river.

Lanius borealis invidiosus. One bird. Rahim concerned and followed it about but in a rather passive way.

Zonotrichia leucophrys pugetensis. Mixed in among group juncos.

Bill a conspicuous and striking yellow with eye line to bill.

Agelaius (Sp. ?) One main flock of about 40 ♀ birds. no. ♂. They were found in same area as last week but in much fewer numbers. Yellow eye line conspicuous.

Euphagus cyanocephalus. 7 birds mixed in among above redwing group.

Melospiza melodia morphna: Omnipresent in all areas where protection affords. Have observed a few trailing Junco flocks but as to how far they attend them is unknown. Their plain and subdued call is hardly logical for such a rugged dominant bird.

Junco oreganus oreganus. Several flocks of from 5-40. They apparently remain in same area as they were found in almost identical areas as of last week. Sexual variation and would not be surprise if the Shufeldts and Pink side are represented.

Regulus satrapa alvaceus. Several small groups, mainly distinct.

Corthis calendula grinnellii. Not many of these birds in comparison with above species.

Setta canadensis: Heard 2 birds in conifer forest east of hospital.

Sporus pinus pinus. 35 birds lit in top of fir tree and then left. Ice of silver thaw partly covering cones and limbs. When they left 3 flocks of some species remained.

Colaptes cafer cafer. About 10 single birds.

Phainopepla nitens torquatus: Occasionally observed.

Thryomanes bewickii calophonus: Common and generally associated with song sparrows.

Sporeus noreus. 10 birds at hospital. One at sundown at river.
