

Annette and I drove down to mouth of Provo River. Two Numenius americanus were feeding in pasture land 3 blocks N and E of harbor. One fed in super-saturated grasses while the other one fed and rested on belly in dry grasses about 150 apart. Approached one and it flew over to other bird feeding in damp area. Lake waters in fields, - mouth Provo River flooded. Fishermen snagging suckers. From here took 1-4-16-46 2-4-16-46 and 3-4-16-46 of the Wasatch Range in panoramic style. 4-4-16-46 shot of cottonwood, willow and tamarisk of flood lake shore. In the Springville pastures took 5-4-16-46 of Mopleton mt and 6-4-16-46 of catclaws with Loafer in background. Waters from Springcreek flooding fields. No 7-4-16-46 of Loafer from pastures north of American Fork.

Pictures taken with graphlet at $\frac{1}{50} \times 32$ stop on Purple S Pan Anaco film (cut.) Have arrived at the conclusion that the best way to record the Wasatch range is to take a series of close shots some 4 miles or less from the mountains proper. The ideal shot would be with telephoto from across the lake but at that distance the atmospheric conditions are not always too good. On return could see hundreds of small ponds and water streams reflected from the excessive flooded pastures and fields.
