sections of kelp

- 1 kelp crab
- 1 hydroid.

From Turn Rock went to east sound and dredged at mouth of bay just beyond cable crossing northward from 12:45 - to 1:00 P.M. as follows:

- numerous Caudina - thick shells
- nemertina - large to 10 inches or so
- sea pens

Compsomyx subclafida - thin shelled clam.
formerly Marcia.

Pandora filosus unsymmetrical bivalve several.

Caudina. approx ten specimens

Noctiluca. clouded water in small patches 1/4 inch.

one Ctenophora in surface collection.

a second dredge of 15 minutes yielded: (South Moran House)

Goldia insifera.

Pandora

Sternopsis

Pectenaria worms

Ctenophora

a third dredging in same area as above.

a fourth dredge in mud at N.E. Upright head gave evidence of considerable material but not identified.

at about 4:00 P.M. made a dredge in shallow bar off Oceanography pier south to Brown island and collected many interesting forms from this gravel and shell bar.

24 June

False Bay, San Juan Island, San Juan County, Washington

Dr Swan and class visited False Bay this A.M. to make a cursory examination of the sand and mud flats. at the upper east end on south side found the following on the high rocks at the high level and in close association.

Littorina sitchana

Littorina scutulata

Acmacea digitalis

Mytilus edulis

Acmaceo pelta

Balanus crenatus

Streblospio benedicti

Many amphipods under rocks

Ulex on rocks

On the sands of the bay proper

Protolucanus tenax

Macoma seeta - large ligament consisting of two
