| <i>Peledma alpina sakhalina</i> | <i>Citellus parryi</i> - (holes only). |

In conclusion *Limnus trimucronatus* has been common in the past as evidenced by runways, nests and holes, especially in damp and wet grassy (and sedges) that lead through tundra between drier adjacent highlands of *Carex*. *Decrastonyx groenlandicus* may be considered uncommon as based on few signs and holes in their typical cottongrass community.

Comita inherited camp, tent, cooking equip etc. and expected to do limnological work in Lake Teshekpuuk. I do not envy his job of portaging his boat to the lake. Departed 8:27 P.M. for Point Barrow. Ice on north shore Teshekpuuk Lake SSW of camp. will probably disappear in a few days or a week. Returning by wing plane at 100-600 ft elevation and on a near straight flight to Point Barrow (2.1 miles per minute).

8:32 1 caribou, 18 old squaws; 8:35 2 caribou; 8:37 loon, Sabine's gulls (2), arctic tern, caribou tracks generally distributed; 8:38 caribou tracks most numerous; 8:47 5 caribou; 8:48 oil drilling camp; 8:49 1 *Larus hyperboreus*; 8:49 over area of exceptionally small, round, closely packed lakes; 8:50 plaver; 8:52 1 gull; 8:56 pectoral sandpiper?; 8:57 2 Pacific loons, 8:58 2 Sabine's gulls; 9:00 joeger; 9:04 4 *Larus hyperboreus*, 2 loon, 2 loon, 18 ducks; 9:06 over shoreline of Arctic Ocean, 23 *Larus hyperboreus*, considerable driftwood; 9:10 arrived over Point Barrow (ARL), land a few minutes later.

Arctic Research Laboratory, Point Barrow, Alaska

Aug. 5, 1951

Arranged and organized trip to Lake Chandler.
