

Checked trapline of 150 traps at 7:00 P.M. and in this short period of time collected: 14 *Microtus oeconomus* and 11 *Clethrionomys*. Most of the *Clethrionomys* were among high shrublike growth or at edge while *Microtus oeconomus* were in open meadows. The *Clethrionomys* were mainly along edge of thickets rather than in center of thickets.

*Clethrionomys* is a vole that requires overhead protection in the form of shrubs or trees.
