

wolf dropping about 1 per 2 blocks (2/10 mile). Tracks of both these animals and caribou in mud along creek. From point east of divide found an American pipit feeding young which could just fly and measured 114 mm total length. Bald sandpiper on high ridge and concerned with one particular area. From divide recorded transect of outcrops to east on east side of river as follows:

north-south transect across valley of Sadlerochit showing highly folded but still in tact the Permian formations. Lusburne Contact may be overthrust.

Lusburne limestone forms sides of valley (synclinal) of Sadlerochit series. These broad valleys of Permian and later aged rocks (Trossus) are conducive to rank growth of

vegetation, green in color. The outcroppings of rock are dark brown and the confining mountains of Lusburne limestone a white. Continued to small lake directly below bald mountain S of camp. The descent is abrupt. Nest of 7 eggs of the greater scaup in grasses at edge of lake. 3 ♂ on water. 1 pr. old squaw swimming together at NW end of lake. Continued up canyon to
