

JOURNAL 1962

JAMES W. BEE

River Bottoms, approx. 2 mi. E of North Lawrence, Douglas and Leavenworth Co., Kansas.

Jan 14, 1962

Surveyed river bottoms from Bismark School, east to mud creek and return. Visibility approx 2 blocks on each side of the road (old railroad grade). Snowing, wind from N, temp approx. 28°F. Snow gradually covering ground and by this evening should be several inches deep. 9:30 A.M. to 10:30 A.M.

Routed covered $1\frac{1}{10}$ miles.
noted 2 singles and one group
of 6 meadowlarks and 1 group
of 12 horned larks. No other
bird or mammal was noted.

Ordinarily this area supports several hundred larks and several groups of longspurs. Horned larks feeding and resting, usually behind some type of barrier such as a hillock of soil or the basal part of a corn stalk or weed. One horned lark limping as if leg had been frozen.

Lawrence, Douglas Co., Kansas

Jan. 14, 1962

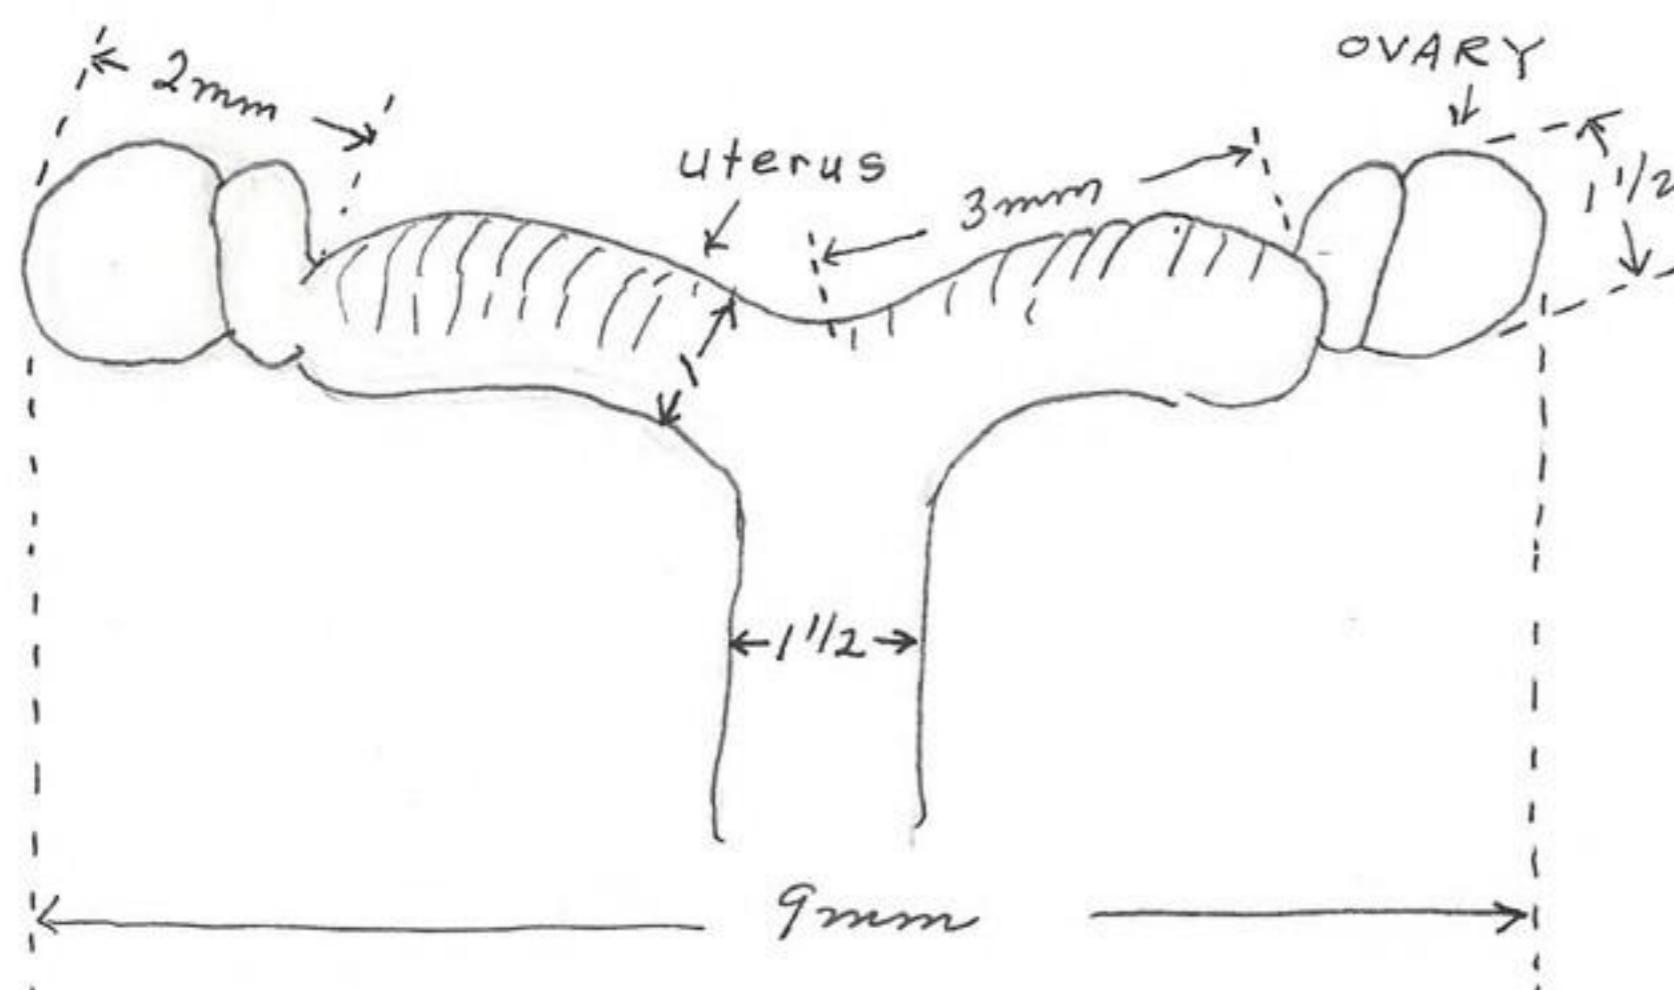

The following birds were at the feeding station at 1620 Tennessee St. up to this date the starling, Eng. Sparrows were the most common forms but today with the new snow cover the variety increased and consisted of the following: Starling (8), English Sparrow (18), Oregon juncos (2), blue jay (1), black-capped chickadee (1), yellow-shafted flicker (1), tree sparrow (1), gray squirrel (1), fox squirrel (1). Complete coverage of ground with snow is more effective in bring many birds and of different kinds to the feeding station than sub-zero weather.

Phi Gamma Delta Fraternity, 1540 Louisiana, Lawrence, Douglas Co., Kansas

Jan 14, 1962

An Eptesicus fuscus fuscus, big brown bat, (620114-1) was brought

to Watkins Hospital, Atchison Kansas, by a student who was bitten by this bat as he attempted to catch it in the fraternity building. The measurements of this bat are: total length 120 mm; tail 48 mm; foot 10 mm; ear from notch 18 mm; weight 18.5 gms. Wing spread 340 mm. Fat on posterior part of body but not excessive. Stomach empty.

River Bottom, approx. 2 mi. E North Lawrence, Douglas and Leavenworth Co., Kansas

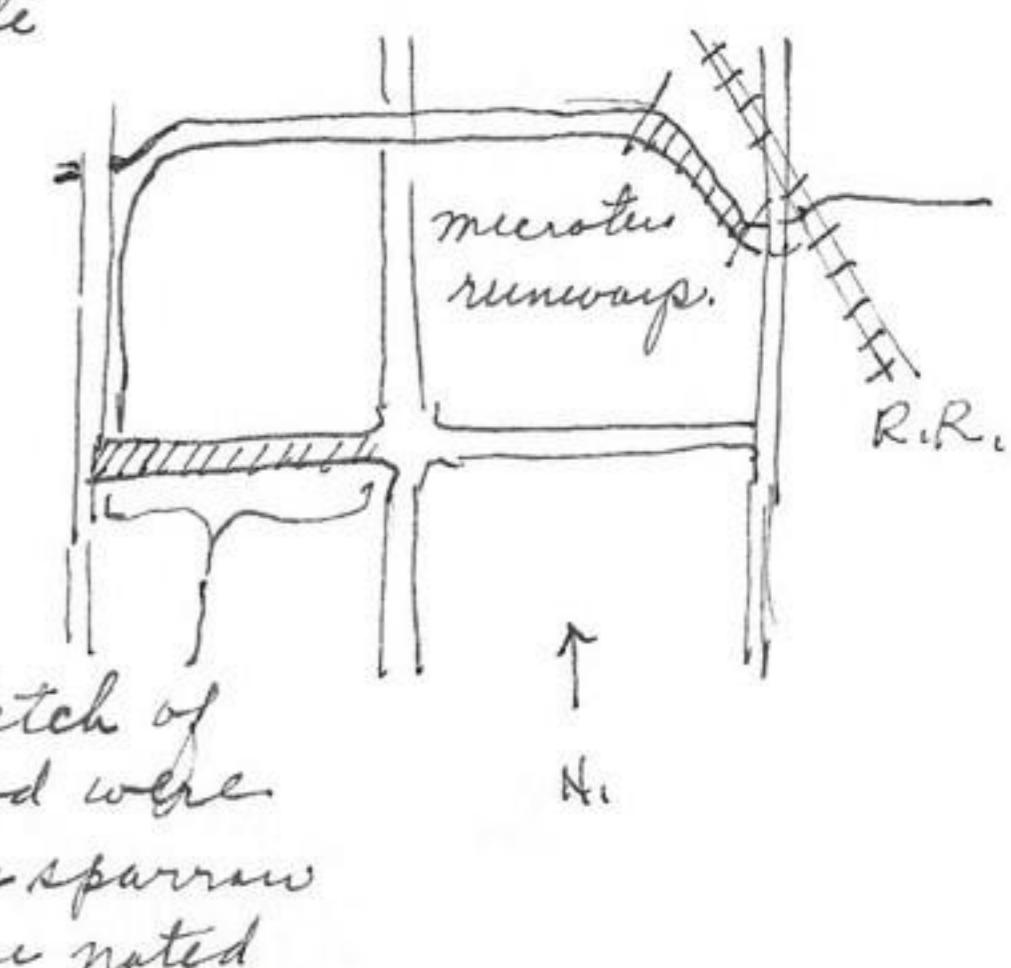

Jan. 21, 1962

Made census of birds (same area as Jan 14, 1962). There were no birds of any kind in area. Day freezing, windy, field covered with deep snow and drifted. Some field entirely of snow, some with weed tops showing. This winter characterized by low temps and deep snows. One weak mockingbird feeding on meat in road about 8th east on Locust Street. This bird definitely weakened by cold & lack of food.

Haskell Bottoms, Lawrence, Douglas Co., Kansas

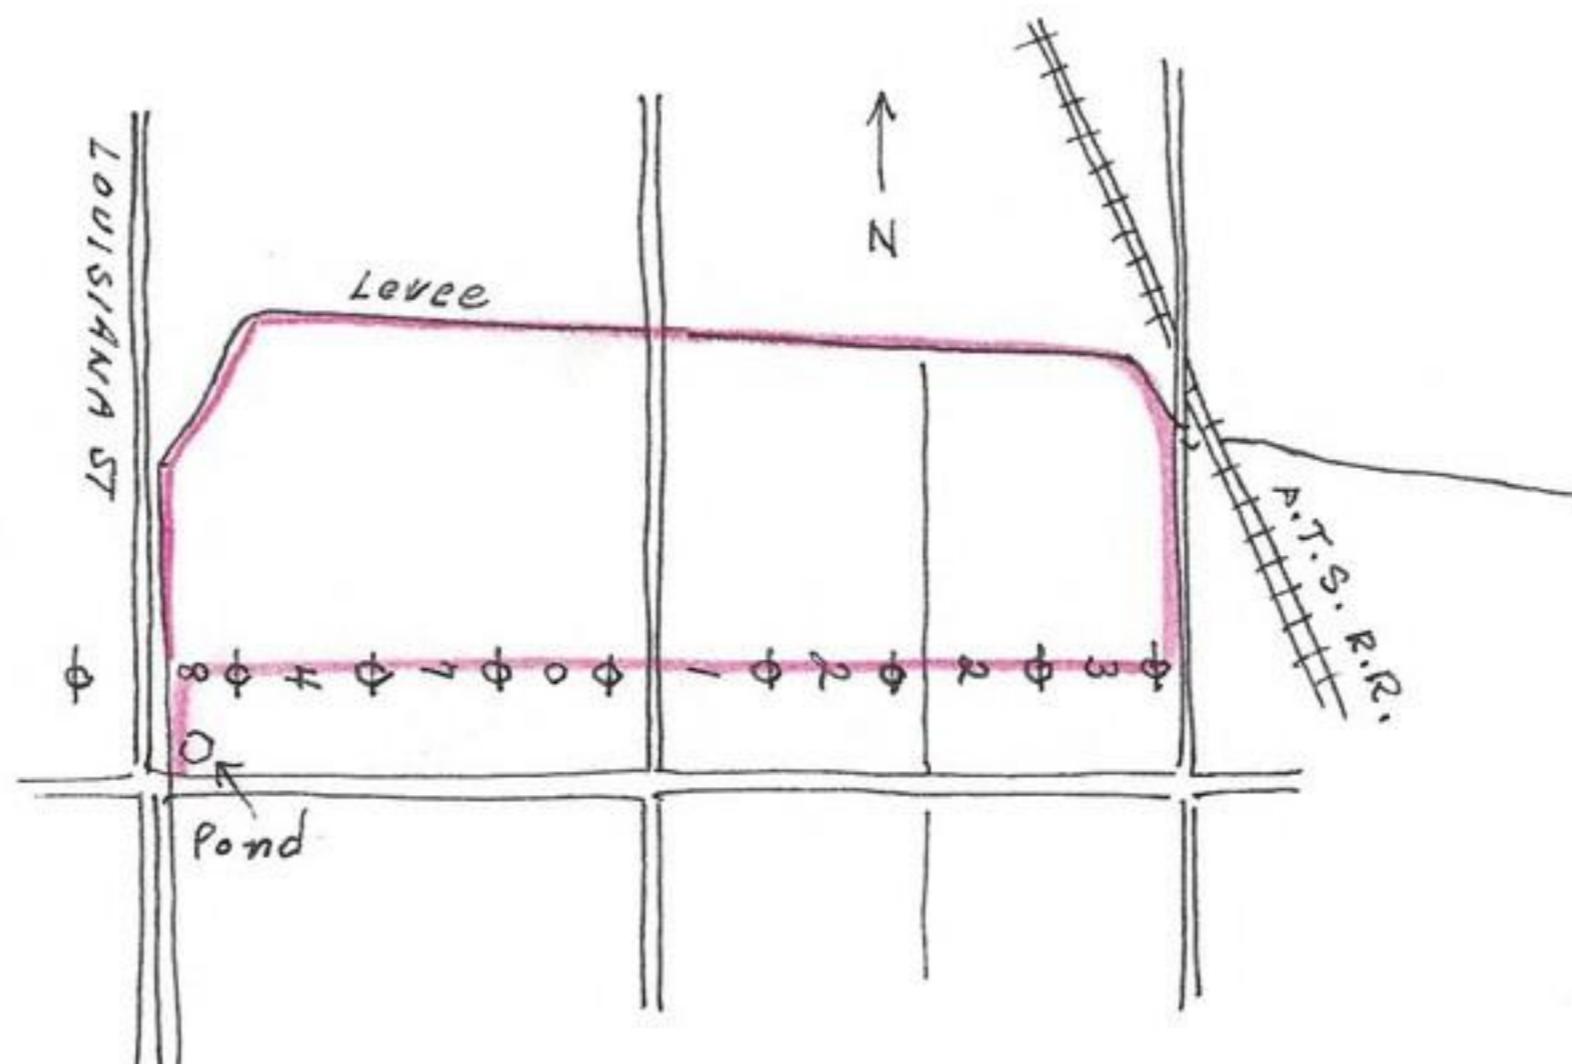

Jan 29, 1962

Wakarusa open but ice jammed at constrictions and at corners or bends of river. ^(completely ice sealed) Channel about 3/4 feet full. The last 2 days have been periods of thaw. In a 1 1/2 mile stretch of road across Haskell Bottoms (20x bridge piers) noted tree sparrows crossing road in both directions at the rate of about 1 per every 2 seconds. They were mainly singles but group up to 5. On dike (as indicated) counted 20 used runways indicating normal population of meadowlarks. One redtailed hawk in area. Several dandelions in full bloom (these must have developed in last two days).

Haskell Bottoms, Lawrence, Douglas Co., Kansas
 February 3, 1962

Made census of *microtus ochrogaster* runway in Haskell Bottoms about 3 mi. S Lawrence (P.O.). This some area has been checked on several occasions in previous years (see notes).

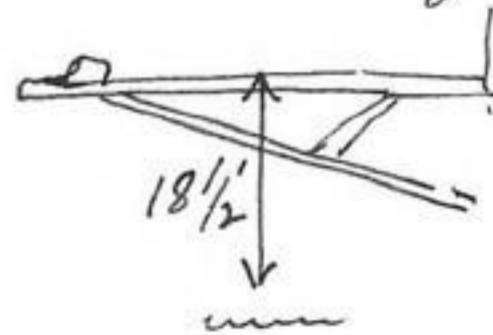

and consists of counting runways in one mile of grassland from Louisiana Street east to Haskell Avenue (E). The area 5 feet wide and 1 mile long in a line through the south pole of the double pole utility line was the transect examined. The number of runways counted are indicated on the above diagram there being 27 in all, or 538 for the entire area of the $\frac{1}{2}$ square mile area. All runways presumably *microtus ochrogaster* on basis of trail construction. All snow gone but solid to friable ice on 80% of the water which in turn covered about 70% of surface area, at least from 10 inches to supersaturated soils. Except a few spots of ponds or temporary ponds, the surface of field was covered with Andropogone & Bromus. This grass was mainly about knee high but visibility good to ground surface. The trails, except in a few cases, were visible and easily counted. They were all well used. Between pole no. 3 and 7 grass good, ice on water; between 6 + 7 like above. There were no trails along drainage creek which at period of high there were hundreds of trails; one shallow pond of cat-tails ice strong enough to support my weight. There were 5 small birds (savanna's) in one mile stretch. Ice on pond except around edges (SW corner). Continued around dike to west to starting point of pond. Along railed noted 14 tree sparrows in groups of 1-2-5-2-1-1-1. 2 meadowlarks they called feebly. 3 cricket frogs called weakly. One *Puomyscus*

*manculus actae, 1 cardinal, 2 dead rabbits (fur only), 1 chickadee, blow flies active, one crow called in tree; great horned owl in same tree. A few minutes 7 crows arrive from two directions; 1 marsh hawk, one cardinal ♂, one cardinal ♀. These were the only birds in the entire Haskell Bottoms examined. Snow on N side of dike, clear elsewhere. Water in drainage canal N of dike muddy, water from Haskell clear and slightly brown, no water from main drainage canal at gate. A dead *microtus ochrogaster* 620203-1 ♀ measuring 161 total length, 43 mm tail, 19 foot, 12 ear from notch and 48 gms was dead in trail. This mouse was in open exposed part of trail between two grass clump and assumed the position of if it had died a natural death and was sunning itself at the time of death. One fecal pellet half way out of rectum. On examination of this animal found penetrating wounds on back. The body cavity below the diaphragm was highly vascularized and the large intestine enlarged to 13 mm in diameter. The liver and lungs normal but venous side of heart almost black in color. Stomach full.*

Wakarusa River from Louisiana Street Bridge Lawrence,
Douglas Co., Kansas to bridge N of Eudora.

February 4, 1962

Canoe trip down river to Eudora (See April 23, 1961 for route covered as this is the same route covered today) with son James Robert. Started 10:35 A.M. and arrived destination 3:00 P.M. or 13.8 miles in 4 hrs and 25 minutes. Canoe carried by current except in quiet waters. At start, temp water at 2 inches below surface in sunlight 40°F, air temp. in shade 49°F, in sun 60°F. Water 18½ feet below bridge (Louisiana St. Bridge). Measurement from horizontal support of bridge. At last time we went down this river the water was 47" from this same point. Will keep total census as far as possible because of the few birds in area at this time of year. These records will be correlated with time.

10:35 A.M. red-bellied woodpecker, junco, 4 chickadees.

10:46 cliffs to right and some ice still on face from water overflowing and freezing earlier in season. The ice was continuous or isolated on cliff. One fox squirrel ran 300 feet along bank to nesting tree (3 tree nests (cleared) in same area. There were

many large trees which the squirrel passed on its way to its nesting hole in tree. Group chickadees.

10:50 fox squirrel; 1 fox squirrel; 4 tree sparrows;

10:53 Haskell tramp dump on edge of river. Chickadees, tree sparrows in area here. It is difficult to estimate number of chickadees but can always hear them.

10:56 fox squirrel ran 100 feet along bank to hole in tree. It was resting on limb about 10 feet above ground in low tree. One ice sheet on bank measured $10 \times 18' \times 10"$. There were a few on bank and many at bends, mostly 5-8 feet above water. Snow on north exposures or where winds from north had built cornices. Tree sparrow; yellow-shafted flicker;

11:00 river quiet today and canoe does not make a sound. Although quiet, the water is fast and only makes noise in areas where submerged trees cut the water or where ripples are formed at edges, juncos; red-bellied woodpecker.

11:07 G. Horned Owl; junco; 2 fox squirrels; chickadees;

11:15. Ice jam solid on bank but melting fast. Large blocks fall or collapse and make a fairly loud noise.

11:18 Haskell Avenue Bridge. Song Sparrow

11:20 G. Horned Owl; red bellied woodpecker.

11:25 Chickadees, red-tailed hawk; fox squirrel; cardinal; fox squirrel; chickadees;

11:35 beaver in water at log jam at edge of river. It remained motionless as we passed and then quietly slide under the surface. Cardinal; fox squirrel; chickadee; red-bellied woodpecker, the latter 4 in a group. These birds along way are generally in groups with areas devoid between,

11:42 Atchison - Topeka and Santa Fe Bridge. Fox squirrel, fox squirrel; fox squirrel

11:50 Chickadees, tree sparrow, hairy woodpecker, downy woodpecker, fox squirrel; 2 red-bellied woodpeckers.

12:00 Cardinal

12:03 at large bend. Red-bellied woodpecker

12:05 2 horned owls together; red-bellied woodpecker, cardinal,

12:07 house. dog 200 feet from house.

12:08 Suspension bridge. Chickadees (all today are, as far as I can tell are black capped).

12:13 red-tailed hawk, juncos

12:15 in constructed area of river, water fast and ice jam on bank on both sides. Water about 5 miles per hour.

chickadees, fox squirrel.

12:22 Construction of river and best logjam on bank. Fox squirrel; downy woodpecker, yellow-shafted flicker, blue jay; chickadee.

12:28 beaver; great-horned owl; chickadee; red-bellied woodpecker, 2 red-tails together; they flew into same tree and were light breasted & winged; heard first crow call; fox squirrel; 2 fox squirrels; beaver tracks in mud; 2 fox squirrels fighting at holes in sycamore tree; chickadee; red-bellied woodpecker; chickadees;

12:41 mouth of coal creek. Fox squirrel, fox squirrel; ck cricket frog called weakly for first time; 6 blue wing teal; fox squirrel; chickadees; hairy woodpecker; chickadees; great horned owl together; titmouse.

12:53 Blue Ridge Mounds Bridge. Red-bellied woodpeckers, 2 oriole nest near bridge and first ones noted; red-bellied woodpeckers. The area before the bridge back to Coal Creek has always been productive as far as bird life is concerned. It may be the nearness of Blue mounds or the farm area.

1:03 red tail; water quiet, no birdlife; chickadee.

1:05 3 fox squirrels; 1 red-bellied woodpecker; oriole nest; cardinal, singing; great horned owl; blue jay; crows calling; titmouse; downy woodpecker; red-bellied woodpecker; fox squirrel; red-bellied woodpecker; downy woodpecker.

1:15 Creek to left. Cardinal; 2 fox squirrels in sycamore; one mourning dove left sunny bank and flew across river; 2 Eng-Sparrows at different trees sing at holes in trees. It is unusual that there are no starlings in area as in summer they nest all along the river. Red-bellied woodpecker; cardinal.

1:22 Utility lines cross river. Trees along river at edge of water are scared by water and log action in high waters (maybe ice also). Fox squirrel; chickadees; cardinal; red-tailed hawk; chickadee.

1:25 Utility line recrosses river. Cardinal; chickadee; red-bellied woodpecker; crow have been calling;

1:27 3 beaver in roots 4 feet above water
They were young of last year (?) and were
in a cavity under the soil and roots.

They slid into river with considerable awkwardness and noise.
and disappeared under water.

1:29 utility pole crosses creek (same one as above). muskrat 100 ft from beaver; fox squirrel; red-tailed hawk; yellow shafted flicker; downy woodpecker.

- 1:43 Cliffs on east side of creek. Eng sparrow.
- 1:46 Bridge crossing river N.S. Red-bellied woodpecker; chickadee; yellow-shafted flicker; cardinal; blow-fly; chickadee, fox squirrel; fox squirrel; red-tailed hawk; fox squirrel; brown creeper; chickadee and other unidentified birds (small); first kinglets; great horned owl; fox squirrel; g. horned owl; hairy woodpecker; red-bellied woodpecker; red bellied woodpecker, these 2 last ones together;
- 1:53 2 crows in tree at edge of river and first ones associated with river, others calling beyond.
- 2:00 Beaver at house in roots of tree above water. These beaver seen today are in dens ^{dirt} above the level of the water; fox squirrel went into nest from 150' away and after about 10 seconds of fighting another squirrel left the same hole; red-bellied woodpecker; 2 fox squirrels at nest; fox squirrel in nest over river; red-tailed hawk; fox squirrel.
- 2:05 Great horned owls; yellow shafted flicker; fox squirrel; fox squirrel.
- 2:06 sharp bend of river and cliffs; 2 fox squirrels; red bellied woodpecker; 2 fox squirrels; 1 fox squirrel; 1 red-bellied woodpecker; titmouse; fox squirrel into hole in tree over water; 2 red-bellied woodpeckers chatter like tree squirrel of nest.
- 2:20 Beaver and house 2 feet above water in open bank; red-bellied woodpecker; 2 fox squirrels;
- 2:22 Cliffs; 2 fox squirrels; cardinal.
- 2:25 2 bee nests in sycamore over water. About 60 at entrance of one hole and 20 at other in same tree. ♂ & ♀ cardinal; fox squirrel ran 100 feet to nesting tree; climbed tree at 1/4 slope
- 2:35 Highway Bridge southwest of Eudora. Jay has paddled or guided canoe all the way. Waters slow flowing for last mile or so. Both paddled to bridge N of Eudora
- 2:38 2 great horned owls; 2 cardinals.
- 2:40 Old bridge pilings; red-bellied woodpecker, chickadees.
- 2:42 3 cardinals; fox squirrel;
- 2:44 R.R. Bridge. Fox squirrel; chickadee; fox squirrel; red-bellied woodpecker; fox squirrel; cardinal; cardinal; fox squirrel.
- 3:00 Eudora Bridge N of Eudora City. Water 2 inches below surface 40°F; air temp in shade 50°F; in sun 64°F. Today has been very comfortable, slight wind from 1:30 to 3:00 P.M.
- In summary, the following number of animals were

noted:

57 fox squirrels. This is a conservative count as I know there were many which I did not see, either because they were hidden or because it is difficult to count on both sides of the river. It is my opinion that most of the squirrels are on the north side of the river because of warmer exposure there. I also believe that the squirrels are paired and although in most case I observed single, the mate was nearby. Several times a squirrel would run into a hole which was preoccupied by another squirrel. It was common to see them running along upper edge of river bank for a hundred or so feet and then climb a tree to its nesting hole. Others were resting and feeding on branch with tail over back; others already high in tree. Some called frequently, others remained quiet. Ordinarily the climb to the nest is fast and climbing into the hole is delayed and awkward in most cases.

7 beaver in singles and one group of three. not many tracks in mud, muskrat.

29 red-bellied woodpeckers - mainly singles but a few in pairs

5 yellow-shafted flickers. singles

4 hairy woodpeckers, singles

5 downy woodpeckers, singles

3 blue jays, singles

6 teal in one group

3 titmouse, singles

4 crows - others heard

1 brown creeper - others no doubt more

1 kinglet group

23 group chickadees generally 2 to 5

4 juncos - probably more

12 great horned owls. there were no duplications, some in pairs

3 English sparrows 2 away from human habitation at ^{at} ~~near~~ ^{holes.}

9 red-tailed hawks - may be duplications

19 cardinals - singles and pairs

4 tree sparrows - may be more.

1 cricket frog.

There were definite groups of birds and then barren areas. The numbers of small birds would be considerably greater if a critical check could be made.

1613 Tennessee St., Lawrence, Kansas

February 5, 1962

In trees on hillside near top of manor "Estate" noted 9 western evening grosbeaks. They were feeding & calling. They left and flew north. The time was 8:00 A.M.

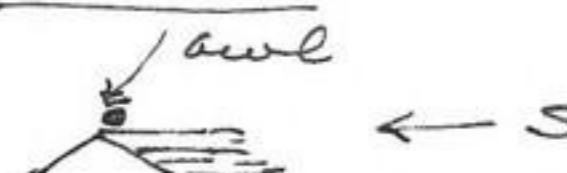

1613 Tennessee St., Lawrence, Douglas Co., Kansas

Feb. 9, 1962

at about 100 feet from above locality noted 26 western evening grosbeaks feeding and faintly calling. They flew north about 300 feet and lit in trees. The time was 12:00 noon. At this time the day was cold and slight wind.

Bailey Hall, Univ. Kansas Campus, Lawrence, Kansas

Feb. 9, 1962

Great horned owl calling from top building at 6:00 P.M. Night cold and slight wind.

Lawrence, Douglas Co., Kansas

Feb. 11, 1962

Collected a Bohemian Waxwing at 2101 Vermont Street. This bird 620211-1 measured 217 total length and weighed 73 gms. Testes 2 mm and white 0 (relative proportion). Stomach and gut with seeds.

Louisiana Bridge, Wakarusa River, Lawrence, Kansas

Feb. 11, 1962

Put son James Robert, Peterson and Richard Dempsey in Wakarusa in canoe at 11:05 A.M. They were to go to Eudora Bridge N of Eudora (about 13.8 miles) via river. At bridge that crosses N.E. across river (Chinese cliffs) they arrived 3 minutes later than our trip the previous week. They counted 1 beaver and 28 fox squirrels.

Lawrence, Douglas Co., Kansas

Feb. 24, 1962 [insert from Feb. 24, 1962]

According to Mr. C.W. Ogle of 200 North St. in a news release in the Lawrence Daily Journal-World, Feb. 24, 1962, there are 25 beaver colonies of 4 to 6 beaver each between Lawrence & De Soto along the Kaw River. The largest beaver in the Lawrence is approximately 70 lbs. One animal from Wamego weighed 104 pounds.

Univ. Kansas, Lawrence, Douglas Co., Kansas

Feb. 14, 1962

Ice on Potters Lake has been gradually disappearing from the completely frozen surface of winter. The ice is restricted to the center of the lake ① in about this proportion.

Feb 15, 1962

Ice gone on Potters Lake for first time this winter.

1620 Tennessee St., Lawrence, Douglas Co., Kansas

Feb. 16, 1962

Eastern gray squirrel carrying dry leaves to hole in tree. Eight western evening grosbeaks in same place as noted on Feb. 9, 1962. Their call is feeble compared to the call of the western evening grosbeak of Utah.

Lawrence, Douglas Co., Kansas

Feb. 24, 1962

(See note following Feb. 11 for this date)

1620 Tennessee St., Lawrence, Douglas Co., Kansas

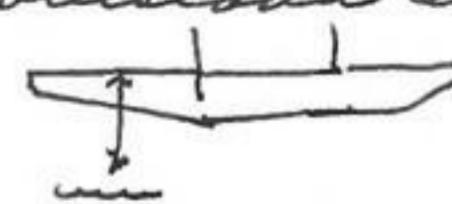

March 1

Starling, ♀, at nesting box placed in tree this winter. It had entered also about 1 week ago.

Lawrence, Douglas Co., Kansas

March 3

Checked Wakarusa from Lawrence to Highway 75 south of Topeka via Clinton, Lickland etc. Water at Louisiana St. Bridge 24 feet 7 1/2 inches from girder to water all along way see on edges of creek, some area completely sealed with ice. 80 snow geese

flying east down Wakarusa valley about 1/2 mi. E of Lickland. They called continuously and were flying about 1000' high. From Lawrence to Highway 75 counted 8 marsh hawks and 7 red-tails, 3 sparrow hawks. At Clinton bridge watch a ♀ bald-pate feeding on insects on surface of water. It maintained its position in creek in same spot in current. along road for about 2 blocks N of Louisiana Bridge noted no birds flying across road where in winter there are always 30 or 40 flying from trees on east side of road to field to west.

Wakarusa River, Shawnee and Douglas Co., Kansas

March 10, 1962

Son James Robert and I made 2 day canoe trip on Wakarusa River from bridge 1/2 mi. N of Richland in Shawnee Co., to Louisiana Street Bridge south of Lawrence in Douglas Co. The following items of equipment were taken: water-proof matches (about 35 were used), small flash-light, extra batteries, wrist watch, ink pens (Lindy, Legal Copy, 474 m) notebook, tent (conical), 30 feet rope, axe, saw, thermometer, wire to fasten stove to canoe, pliers, mops, ground cloth, sleeping bags, measurer, scales, dissecting equip, pocket knife, warm cloths for rain and snow, canoe, paddles, stove, 4 lengths of pipe, water, food, gun, shells, binoculars, life preserver, bird book, permits, cotton gloves. The objective of trip was to determine any shift in winter population of birds (see notes Feb. 4, 1962). Left Lawrence 6:10 A.m and arrived Richland bridge 6:50 A.m. Annette returned ear to Lawrence. Departed by canoe 7:30 A.m. Raining gently, partial sleet, sky overcast and temp. about 36° F. It was planned to make a complete census of all birds and mammals but control of canoe through obstacles of river did not allow consistent note taking. For a complete census it takes one man at canoe and one man on note taking. I did take a full count of the great horned owl, red-tailed hawk, snow geese, ducks, beaver, muskrats. All other forms were recorded by summary. Time correlated with bridges and other major land marks. The first day from Richland to Clinton Camp of 13 1/2 miles took 9 hrs and 5 minutes or 1 1/2 miles per hour. This speed is considered average for cruising these creeks in low water and means that only enough paddling is employed to keep canoe on course and to cross slow water. The second day we covered 17 8/10 miles in 6 hrs and 45 min or approx 3 miles per hour and involved both James & I paddling together most of the time. I would consider that 2 miles per hour for long distances is a good speed for observation and canoeing although a slower speed is good for short distances and when many birds are to be checked. In winter there is a limited kind and number of birds. The weather for the two days was (10th) raw, sleet, cold in early morning, cloudy and cold all day except evening when sky partly cleared but followed by thunder cumulus clouds,

lightning, strong wind for short while and then rain showers into late night. Morning of 11th sky clear & blue, temp cold, no wind but followed by sudden clouding of sky in mid-morning followed by cold rain, sleet and considerable wind. At noon skies partly cleared and high wind for rest of day. The wind is only partly felt in low entrenched creek except on long exposed course.

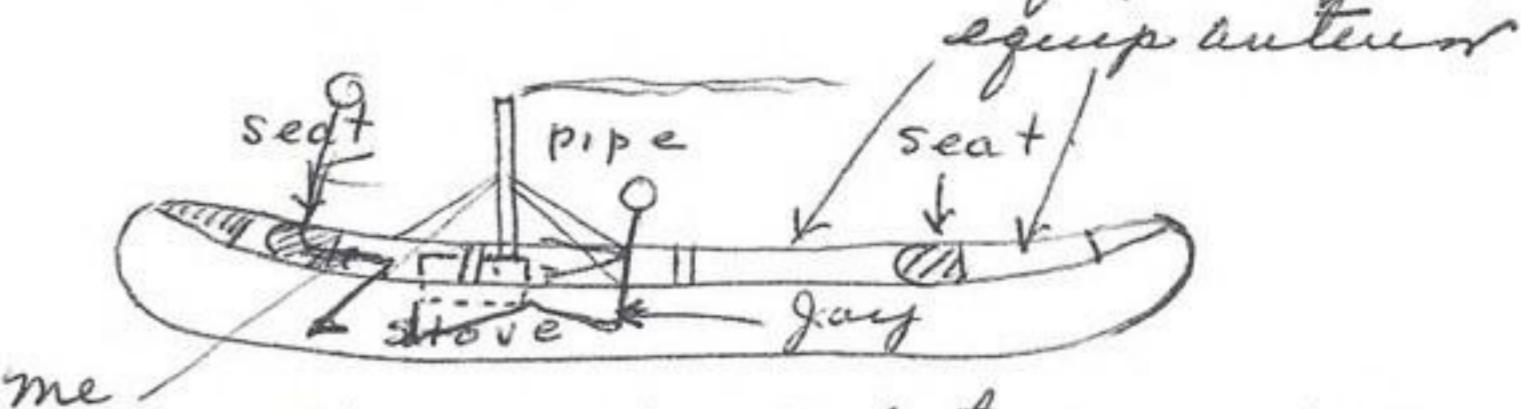

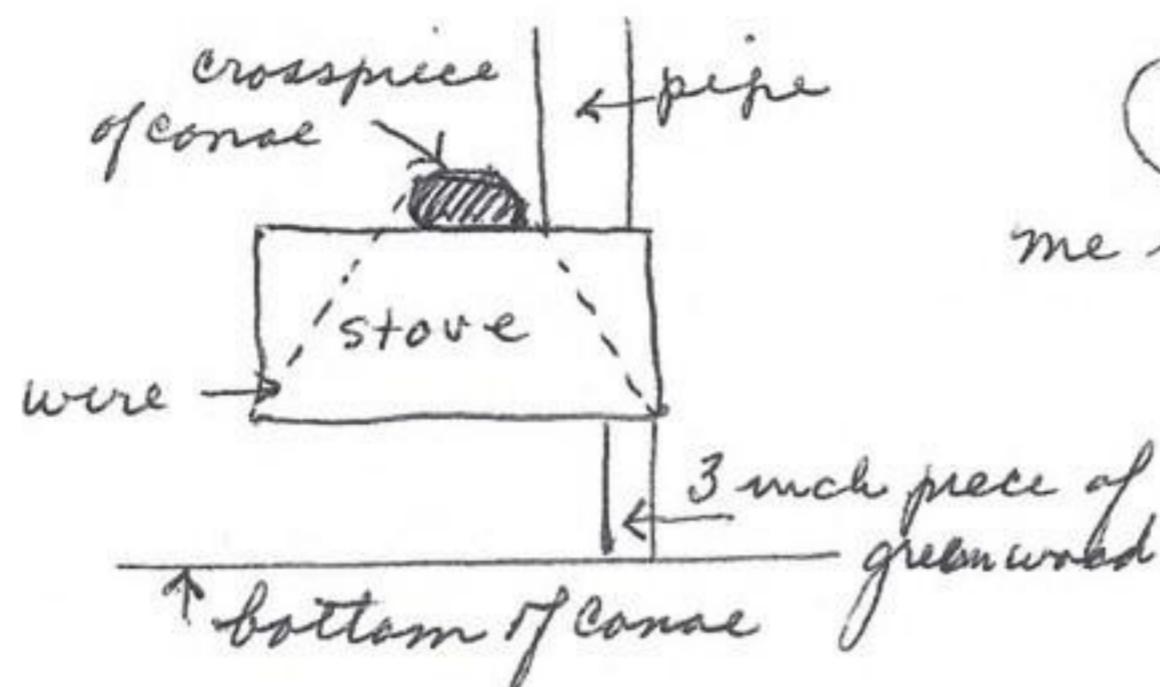

Departed Richland (bridge) at 7:30 A.M. 8:23 A.M. first ~~rapids~~
~~cascade~~ below a rock barrier placed in Wakanusa river by creek entering from the north. This was to be the pattern of many ~~cascade~~ rapids encountered today. The limestone boulders are deposited about 10-20 feet downstream from mouth of small creek and may be a few inches high or 3 or more feet. Size of rocks are governed by the carrying capacity of the side or lateral streams. The barrier is generally in center of stream and water passes on each side. The profile of the ^{low water} body of the stream is a V shape and are graded to the Wakanusa (larger ones). Smaller ones enter at a steeper grade.

8:26 A.M. G.H. owl left tree and flew down creek. 8:34 18 ducks fly by overhead but had no intention of using river. 8:50 2nd rapids, 3

crows beyond trees and annoying 2 great horned owls. 9:15 4th cascade. 9:30 now along base of cliffs on south side of valley. In the heavily timbered area along south side of valley noted a colony of great blue heron nests placed in three adjacent sycamore trees on south side of river. Largest tree with 16 nests, second largest 6 nests and smallest 1 nest. The nests all in upper and generally outer branches of tree nesting tree in secluded woody section and not at all like those in the west which are in isolated stands of trees. 15 minutes beyond but on switchback of creek noted one single nest in a tall sycamore. It would have been easy to have missed this nest in summer. 9:48 1 great horned owl harassed by 16 crows. 11:00 first

bridge (remained here 1 hour for lunch and to secure stove and pipe to canoe gunwale. Temperature too low for comfort of feet and legs

Stove attached to cross support and pipe fastened by wire to canoe.

12:30 G. Horned owl. 1:30 360 snow geese in V formation fly at a leisure gait to N., some may have been blues. Temp. at this time 44°F and cloudy. Water 38°F 2 inches below surface. 2:10 second bridge, 2 red-tailed hawks, 40 snow geese flew N in V formation. 2:35 2 beaver in some hole 1/2 foot above water level; 2 great horned owls. 2:30 2 red-tailed hawks, one carrying a squirrel or part of it; one great horned owl. 2:50 two beaver from some bank den. 3:00 extreme east segment and abrupt turn back to west. 3:30 G. Horned owl. 3:40 G. H. owl. 3:50 large flock red-winged blackbirds (500) singing in tree about 1/2 block from creek. 4:00 Clinton bridge (west of Clinton) 1 red-tailed hawk. 4:15 beaver and first bank house of sticks.

The accumulation was shallow but evidence of a stick house. most

of dens are under root system or holes in bank without ^{home or layer} ~~nest~~ of sticks

Arrived camp at 4:35 P.M. approx. 9/10 mi. W and 9/10 mi. N Clinton (store in center of town).

Pulled canoe to top of bank above highest water level and

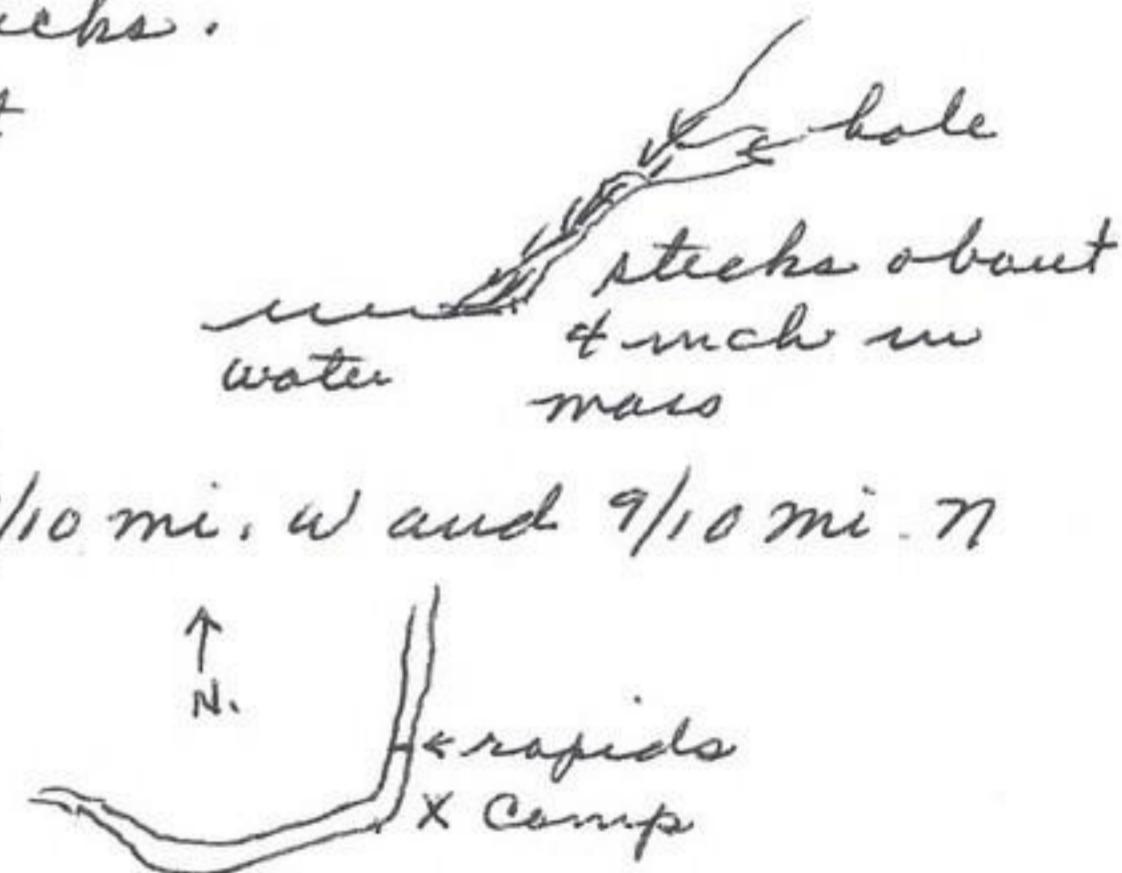

made camp on a very interesting vantage point overlooking stream and rapids below.

This evening heard g. h. owl calling. Slept in canoe tent and used inside stove for early evening.

9/10 mi. W + 9/10 mi. N Clinton (store), Douglas Co., Kansas

March 11, 1962

While getting breakfast both James & I heard a loon call at about 7:00 A.M. Both he & I are well acquainted with this call. The inside wood stove soon dries a rain soaked tent. Left

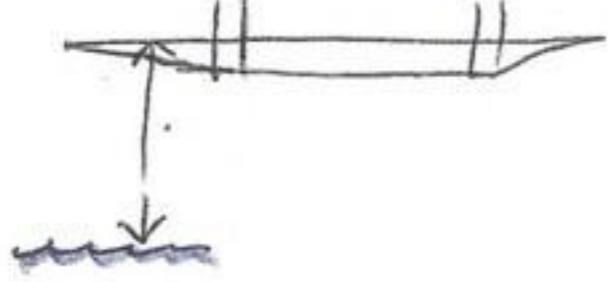

14
Camp at 7:45 A.M. Killdeer calling from field on N side of river. Air temp at this time 38°F . 7:55 G.H.owl; 8:55 G.H.owl. 8:56 Deer Creek from N. 8:50 1 beaver, 2 red-tailed hawks. 8:03 1st bridge. 8:12 G.H.owl; approx 26 paper-nest wasps nest in tree at edge of creek and 50' from barnyard (heard pigs and no doubt cows there also). These wasp nests average about 1 per every 100 feet and occur mainly as singles, some ^{trees with} 2 or more but seldom more than 3 in same tree. They are generally in lower branches of trees over-hanging creek. G.H.owl; 12 mourning doves across river from barn; up to now have seen only 5 fox squirrels this A.M which is a very low number. I believe the bad weather accounts for this low census number. 9:00 2nd bridge; 2 red-tailed hawks. 9:10 high bank and abrupt probably formed when Kaw River ran through this area in Pleistocene times. At this point a fox squirrel was noted swimming across the river which was about 30 feet at this point. It left the N. bank of treeless mud slope and swam S across river to high cliff. The squirrel runs high anteriorly and swims directly across and onto bank without hesitation. Temp. H₂O 39°F , air temp 44°F . Red-tailed hawk and great horned owl in area. 9:45 2 beaver in same bank den, they left with a splash, one at a time; wood duck. 10:10 great horned owl. 10:15 2000 snow geese and 3rd bridge also 1 red-tailed hawk and 1 great horned owl. 10:30 Rock Creek from S; on great h. owl being harassed by 18 crows. 10:30 red-tailed hawk; 1 g. horned owl; 2 beaver from same bank nest ^{4 feet above} at water level. ~~10:40~~ g. h.

The first one left by almost diving straight into water. It was dark in color. The second one left a few seconds after and also practically dove from nest to water. It was light in color. Great horned owl in area. 10:45 3rd bridge; great horned owl. 11:20 red-tailed hawk flew from near a nest in a high sycamore tree. 11:30 G.H.owl. 11:35 4th bridge. 11:40 G.H.owl. 12:30 Highway bridge no 59; red-tail. Near bridge Jones shot a male fox squirrel with testis measuring 31 mm length. 12:50 Red-tailed hawk. 1:30 Louisiana bridge S of Lawrence and end of trip. The last $1\frac{1}{2}$ miles covered at current speed.

water at bridge 25 feet and $2\frac{1}{2}$ inches below cross beam of bridge. Annette picked us up at 2:00 P.M.

Summary of observations of birds and mammals:

Great horned owl. 18 singles and 2 pairs. Generally in trees bordering river and about 25 feet above base of trees. Would leave at about 250 feet and fly down creek for about 400 feet and alight again. After approach a second time would generally leave creek-edge timber. These owls would not fly down creek as far as in February. Crows would continually harass owl if the crows were in area. Squirrels and other birds did not seem to react to the passing owl. One owl was under an overhanging bank among roots about 8 feet from water.

Red-tailed hawk 4 pairs and 6 singles. Pairs seemed to remain in same area. On second day in high wood, several were noted flying high. On calm day the hawks were not in air soaring. One of a pair held a fat squirrel in its feet as it flew from its perch in a tree. The red-tails near come nearer to us than about 200 feet. They called.

Snow geese 3 large flocks 360-40-2000 passed overhead to N. One large flock (2000) flew high and twice as fast as the group of 360. Did not hear geese pass by at night.

Crow. Some large flocks 16-18, some small groups. Remained beyond immediate confines of creek and bordering trees. Their contact is with open field-forest.

M. doves. Only three groups 12-3-2 and associated with farm houses.

Wood duck. 1 in river and only duck along entire course of river.

Ducks: 4 small groups and one single in air. It is surprising that we did not see more ducks on the river.

Marsh hawk, one bird. The previous week on an overhand route in same valley counted 6 or 7.

Nuthatch, red breasted. For every hour of travel probably heard 2 or 3.

Chickadees, blackcapped. More numerous than nuthatches by 10 times.

bluebirds. Generally distributed in favorable places, other areas devoid of these birds. No large flocks but singles and probably on territories. In some areas about 1 per every $\frac{1}{2}$ mile. Approx 30 birds noted. They were calling.

Blackbirds: 8 singles, 4 groups of about 5 and one large group of approx 500 which had collect in evening for roosting.

Robins Four in one group.

Starling. Only one groups of 3 noted.

English Sparrow. Only around farm houses

Kinglets Heard only 2 groups.

Juncos (Oregon) One group of 12 and a few smaller groups. They were the only birds noted on old flood banks adjacent river.

Yellow-shafted flicker. Only 5

Hairy woodpecker 7

Downy " 14

Red-bellied woodpecker About 1 per mile. Some areas better than others but population not to be compared with census in February because of unfavorable weather today.

Cardinal One of most common birds. In favorable areas about 10 per mile. Some areas without these birds.

Meadowlark only one

phoebe. 4 birds at widely distributed points.

blue jay 3 singles & 2 pairs

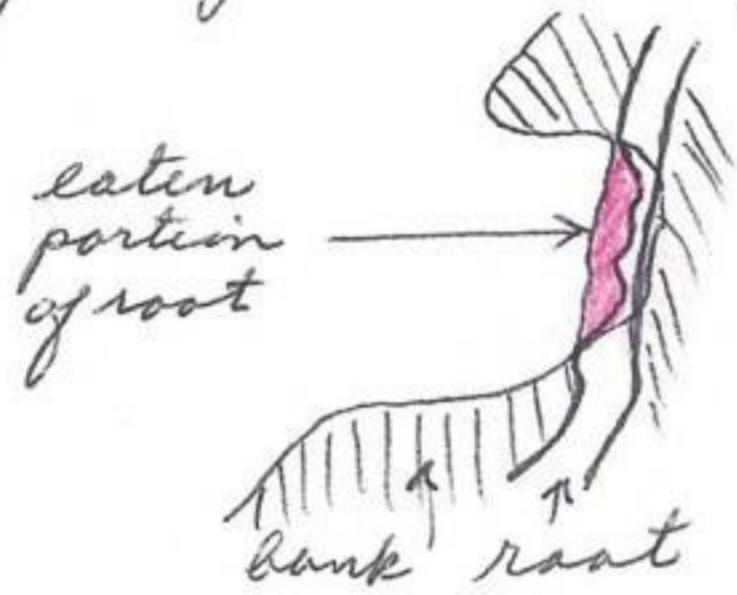

Titmouse about 4 per mile and generally distributed.

loon (?) Both Jones & I heard a loon flying overhead at about 7:00 A.M. the second morning.

Killdeer one bird on second day in morning

Beaver Four pairs and 2 singles were actually observed, but I am sure there are many more along river on the basis of the sign. I would estimate that there are, at least in favorable places, 3 pairs of beaver per mile. I would judge that $\frac{3}{4}$ of the river is used by these animals and showed sign of digging, chewed willow, dens, tracks in mud and slides on slopes. The pairs we noted were in shallow bank dens from water level to 4 feet high. Both animals were in these bank dens. They may be the young just starting new territories. Other deep dens may have supported other pairs that did not leave dens because of their protection. One pair was in a shallow hole dug under a shallow root system and 4 feet above the level of the water. a covering of small willow sticks extended from the den to the water level. As we passed by it about 10 feet away.

a light colored beaver jumped & slid down into the water with a splash followed by a second dark colored beaver which also practically jumped into the water. They swam underwater up creek. The two most commonly used holes are one at water level and the other about 4 feet above water. Some are 10 feet up bank under roots of trees. Considerable digging in bank for roots at about $1\frac{1}{2}$ feet above present water level and varying in size from a hole 4 inches in diameter to one the body size of a beaver or larger (up to double the body size). In practically every case the shallow hole ended at a root from a small shrub or small tree. The root was either barked or completely cut off. I am wondering if these roots were excavated and eaten at a time when the ice covered the river and food was not available. The diggings, however, appeared fresh. The holes did not go beyond the digging. Some of these holes are used as resting places and for feeding on grasses and small stems as on some of the floors there was an accumulation of debris. This debris could have been placed there by muskrats, which use the holes dug by beaver. There were other holes and scraping of soil made by beaver. Tracks were common on shore as well as up and down the bank. A smooth trail up & down the bank indicated the dragging of the belly across the mud. There were no extensive trails which are more common later in the season. In areas being actively used there were small cleaned limbs on the bank but not as numerous as later in the season. About 8 trees had been cut but main feeding on small willows or birches $\frac{3}{4}$ inch in diameter. Beaver no doubt use the entire river course but there are definite areas where these are concentrations of beaver, especially where the water is slow moving & deep. Only one bank den was reinforced with a house of sticks and this house was had only about 6 inch of sticks below the hole. It would be interesting to study the adaptation of the beaver along the Wakarusa in respect to the influence of the variable water level.

of the river. In late summer it is possible for beavers to build dams across the river. In flood times there is not even a high den available. One day a den is conveniently placed near water level and the next day is 10 feet high and dry. Do they have several dens that can be used according to the changeable water level. When are stuck houses built and what are the modifications.

Fox squirrel: Those observed were singles and pairs - never in threes. While we did not see many because of the unfavorable weather the number of nests indicate that the population is normal for the region. Cold & rainy weather keeps the squirrels inactive. We observed for the first time a fox squirrel swimming across a body of water. One crossed the full width of the river of approx. 30 feet. The crossing was direct and without deviation of course or speed. On the basis of swimming habit it could be differentiate between a squirrel and a muskrat. The head and shoulders ride high in water.

Raccoon: Tracks all along Wakawea but mainly between Richland & Clinton in areas adjacent timber of side of valley.

Muskats, 5 observed but probably many more.

Cottontail rabbit. Although we passed through favorable areas we did not see a single cottontail which was one of the most interesting facts of the trip.

Cats. No cats along entire route.

Dogs 2 hunting pairs without hunters; a great source of disturbance to wildlife.

People. We did not see a single individual on the two day of travel except as ears passed over bridges.

Carp. One left the edge of bank; others feeding but to the extent of 5 or 6 only. Not much surface action.

Paper nest wasps (see account in census)

Gnat. In the more quiet sections of the river we observed a black gnat flying about 4 feet above the water. No other insects noted.

I was impressed with the fact that birds and mammals are not as active in cold - cloudy - rainy weather as they are in the sunshine. The squirrel population was only a fraction of what it would be on a sunny day. This points out the importance of making census under similar condition of weather and time of day, and season of year, otherwise

there will be serious errors in the census. Some days squirrels are on all sides while on other days there are practically none in sight. Bird populations can be censused only under identical conditions if the results are to be comparable. On this trip there was inactivity and area quiet until we fired a gun and then 7 or 8 birds be react and make their whereabouts known. The best conditions are a warm or at least sunny windless day for greatest activity and singing upright.

There are old stumps of unusually large size that are in, or at edge of creek proper and are probably trees of a time ~~that~~ when conditions were different than today as I did not notice any modern trees ^{of similar size} in such a position. One area of land displacement included 5 large trees. The common number is one. Some large trees completely blocked creek channel and extended from one side of the bank to the other; some bridging above, some at water level and blocking canoe traffic and some slightly submerged.

The physical feature of the creek are varied and interesting. Some areas are undergoing what I would call major adjustments of erosion and soil displacement. There are various causes of narrow channels, one from landslides from one or both sides without tree obstruction, another with slides and trees blocking water flow. Lateral creeks deposit solid limestone rocks which frequently cause a narrowing channel and deposition of soils. Slopes of

varying character line the edges of the river.

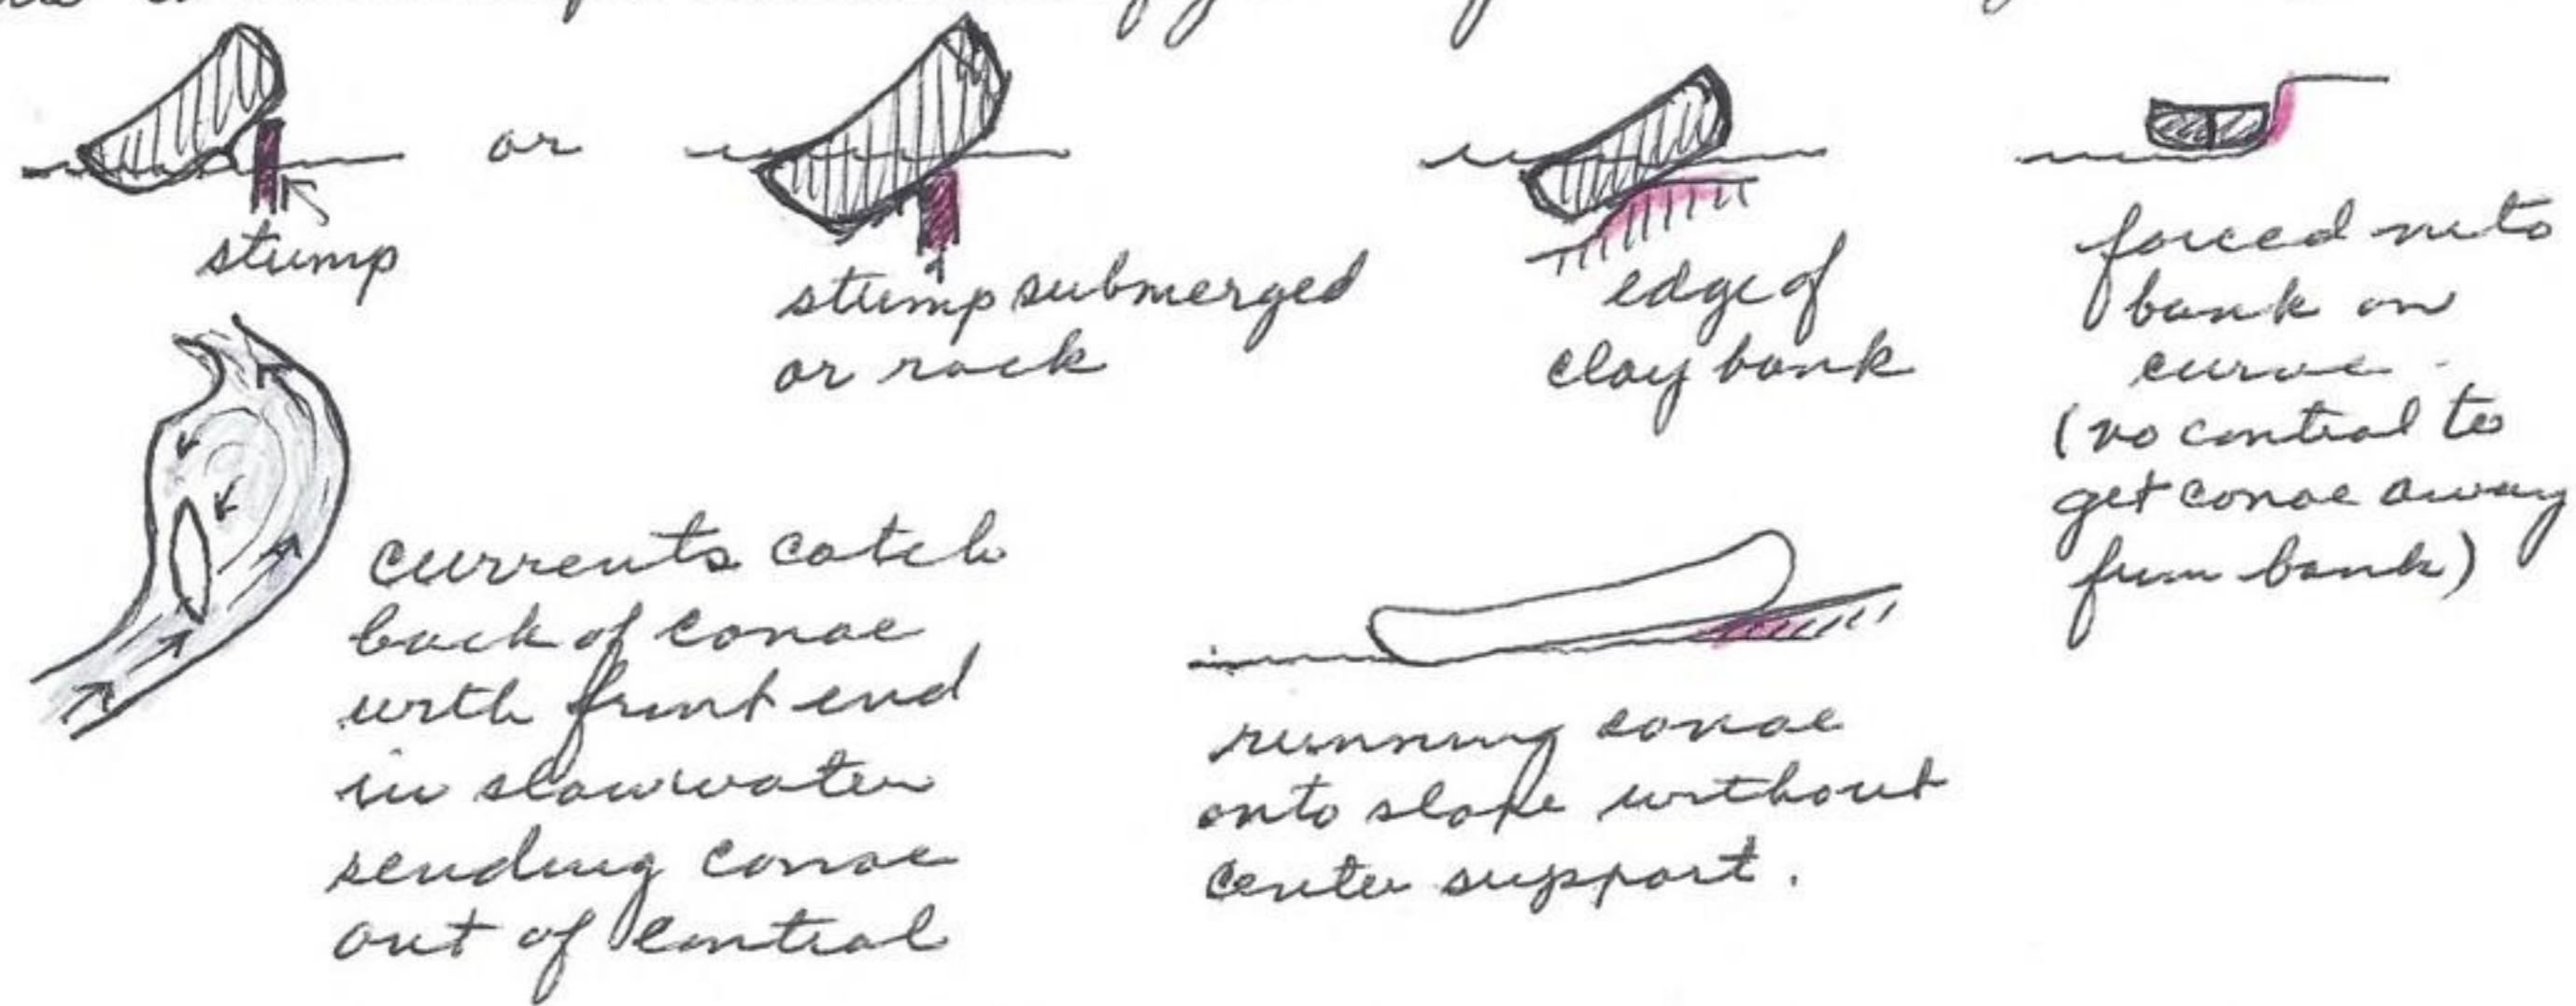

Soil creep or slides are common and generally carry trees. Rapids are

caused by a debris barrier from lateral creek, exposed resistant strata of rock, old clay accumulations, slides and perhaps faulting. Vegetation is distributed irregularly. Large trees are generally confined to upper slopes except when displaced by

soil slide. The vegetation on lower slopes is generally small and of the willow type. Some areas however, have small tree growth almost to water level but such areas are ^{completely} uncommon. Some slopes with grass to water level, ^{some bare}.

Most rapids at this level of water, can be run with canoe. About 15 rapids required lowering of canoe with rope; otherwise canoe would be hung-up by either rocks or soil. The worst danger is hitting submerged top of stump which in certain areas are numerous. One such stump stopped us and held canoe in spite of several 360° rotations of the canoe. The greatest danger is that at higher speeds, the canoe can be tipped over on its side. When released the tendency is to overshift the center of gravity. Some hazardous positions:

Noted about 8 large blocks of ice 8 feet long or so on upper slope of channel which were deposited there during period of high water and first ice breakup. These masses of ice lined the creek early in season. Ice lined the edge of creek in protected places (about 1 foot wide) and was either at exactly at the water level or slightly above to as much as 4 or 5 inches. Some ice still remained from water falls on side of banks. Water clear to about $2\frac{1}{2}$ feet. Side creeks ^{associated patches of foam} clear. Some pools of quiet water supported ^{ice} floating in water.

At the Haskell Bottoms on Louisiana Street noted 6 male redwing blackbirds on territories. No females in area.

On March 10 the ice on Potters Lake on the Univ. of Kansas Campus was melting around edges and in parts of center. On our return March 18, evening, the ice was completely melted. This is the second time this winter that ice has left lake.

The river has been favorable for canoeing the last mile or so.

Creek from S with characteristic barrier of rocks to form rapids. 10:55 great horned owl, 1 fox squirrel. Evidence of beaver in long stretch of river. 11:06, 2 wood ducks, male much darker. These

ducks were at the old bridge. 11:08 new bridge. From this bridge to about $\frac{1}{4}$ mile upstream, the canoeing water is good. 1 fox squirrel. 11:12 Burris Creek from S, good size. 1 fox squirrel. 11:22 good rapids 2 fox squirrels and 1 red-tailed hawk. 11:33 Photo 620318-1 of three large elm trees at edge of river (probably undeposited). 11:42 great horned owl. 11:48 fox squirrel. Up to now I have seen 4 frogs along side of river but in the next 5 minutes noted 8 more. 11:54 Photo 620318-2 by James Robert in canoe along side of basal roots of a large sycamore tree. These large trees offer excellent protection to erosion. Last week I was of the opinion that there were old large tree stumps in river that are not now living but on the upper reaches of the stream there are many large trees at edge of river. 12:00 Passed house & silo where utility lines cross river. 1 fox squirrel. 12:05 bridge. 12:15 ♂ & ♀ wood duck. These ducks leave water and fly almost straight up to tops of trees where they leave the river course. 1 fox squirrel. 12:37. ♂ & ♀ green-winged teal. 12:45 S.H. owl. 1 fox squirrel. 1:12 G.H. owl. 1:35 2 red-tailed hawks, 1 G.H. owl and 1 wood duck. 1:50 steepest natural cascades of entire river covered so far. 1:55 4 wood ducks. 2:00 Lynn Creek, just beyond about 1-block collect 1 yellow-crowned night heron. It measured total length 560 mm, bill 70 mm, tarsus 98 mm, wt 572 gms. The testes measured right 16 x 5.5 mm, left 16 x 5.8 mm.

2:07 2 wood ducks,

2:12 bridge. 2:15 1 fox squirrel, 1 red-tailed hawk

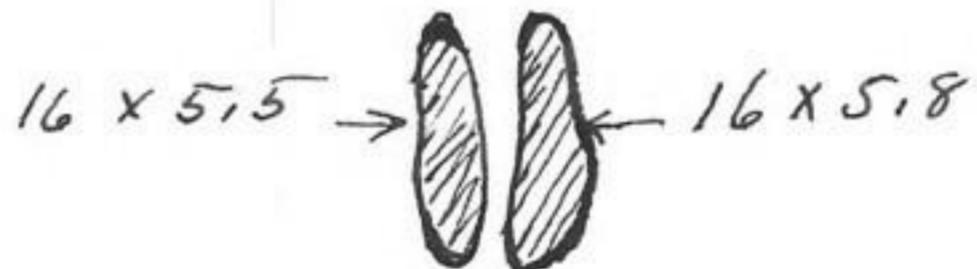

2 fox squirrels. At 2:20

noted a pool of clear water

that was separated from the main stream of water. It was produced by a lateral creek placing barrier at mouth. ^{2 G.H. owls, 2 wood ducks, 2 fox squirrels}

1 great horned owl. One small turtle about 2 or 3 inches long left mud bank. 2:54 R.R. bridge.

3:14 unusual mass of *Equisetum* completely covering creek slope about 30 x 40 feet from top of bank to edge of water. First frogs calling to south,

23

probably from a pond beyond the river. 3:20 collect a song sparrow 620318-4 from side of creek. I had seen only 2 others. 3:20 2 wood ducks, 1 fox squirrel. 3:45 arrived Hickland bridge about $1\frac{1}{2}$ mi. N of ~~town~~ town. 74 hours and 15 minutes travel time at approx. 2 miles per hour. At bridge collected 1 slate-colored junco 620318-5 and 1 eastern phoebe 620318-6. The phoebe was a male and its testis measured:  l. $4\frac{1}{2} \times 2$
I estimated that we made 1 portage of 30 feet,  r. $3 \times \frac{1}{2}$
3 rapids to shallow to navigate but canoes lowered empty with rope and about 60 which we row with occasional striking of rocks. Topography varied. At upper limits a platform of limestone along edge of creek, a bank of solid shale the rocks oriented in one direction in creek bed. The stretch of creek covered today has small black willows and other small trees growing down to water edge. Grass also lines slopes. There is less erosion of banks than lower limits of Wakarusa. The following summary of birds observed:

blue jays - singles, doubles usually and 2 groups of three, 9 noted.
Crow. 2 sections of the river had small groups of crows which were feeding on material in the creek bottoms. On the trip last week we saw & heard many crow but did not see them in the creek proper. They were not organized to fight g. horned owls as was the case last week.

eastern blue bird. Only 14 seen and heard. one δ expressed curiosity at 15 feet from canoe at one of the rapids. They were frequently heard singing.

Cardinal. One of the most common birds, generally singles or pairs but a few in mixed flocks of other birds. Many singing and in favorable stretches about 1 per 100' block.

song sparrow. 4. definitely one of the few birds that are found along edge of creek among drift debris & brush. Some singing.

hermit thrush? One bird which had a reddish tail among drift wood pile (could have been a fox sparrow)

wren - 3 among debris of drift wood along side of creek. sp.?

mourning dove singles to group of 8 generally distributed. 15 total

Red-tailed hawk. 1 pair calling, 2 singles.

green-winged teal. $\delta + q$

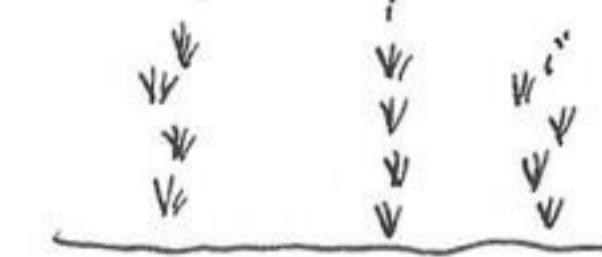

wood duck 1 single δ , 5 pairs; 1 group of 4

Am. Coot 1

Snow geese. One flock of 50

Am. Robin 18 in small groups.

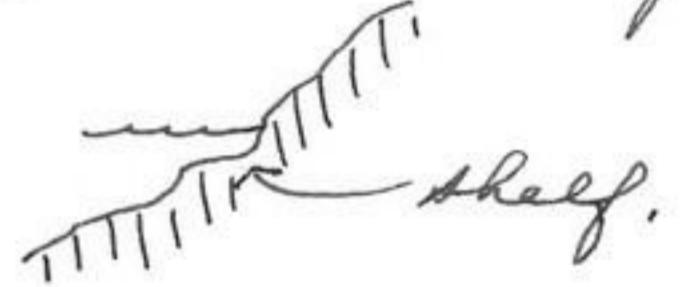

downy woodpecker - 14
 red-bellied woodpecker - 18
 flicker - 4 (yellow shaffter)
 hairy woodpecker - 11
 red-wings - one along edge of river, small groups, in trees.
 Oregon juncos - small groups
 slate colored juncos - " "
 eastern phoebe - 12 generally distributed, some associated
 with winter groups of small birds.
 blackcapped chickadees - small groups.
 nuthatches - few
 kinglets? heard only
 Great horned owls. 9 singles, 1 pair
 killdeer - 1
 titmouse - 28 generally distributed and singing
 meadowlark - heard 3
 no starting
 Eng Sparrows - few at farm houses - 1 pair
 racoon - tracks generally distributed. The characteristic
 track pattern is sets of perpendicular imprints up steep slope.
 Racoons feed along edge of river and at
 certain points move up bank to check material
 and then return to water edge. At most places
 along river there is a ^{submerged} shelf of eroded soil
 which is made, I believe, and used by
 racoon. The shelf is at water level.

Racoons feed along edge of river and at
 certain points move up bank to check material
 and then return to water edge. At most places
 along river there is a ^{submerged} shelf of eroded soil
 which is made, I believe, and used by

raccoon. The shelf is at water level.

These animals are not as common in this
 stretch of river as below Richland.

Muskrat. Did not see but evidence especially seen on logs
 at water level.

Beaver. Did not see but evidence. They are not as common
 here as on lower stretches of Wakarusa.

bees - 2

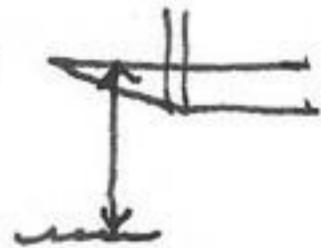

gnats - in quiet parts of river

fish - not much evidence of surface feeding

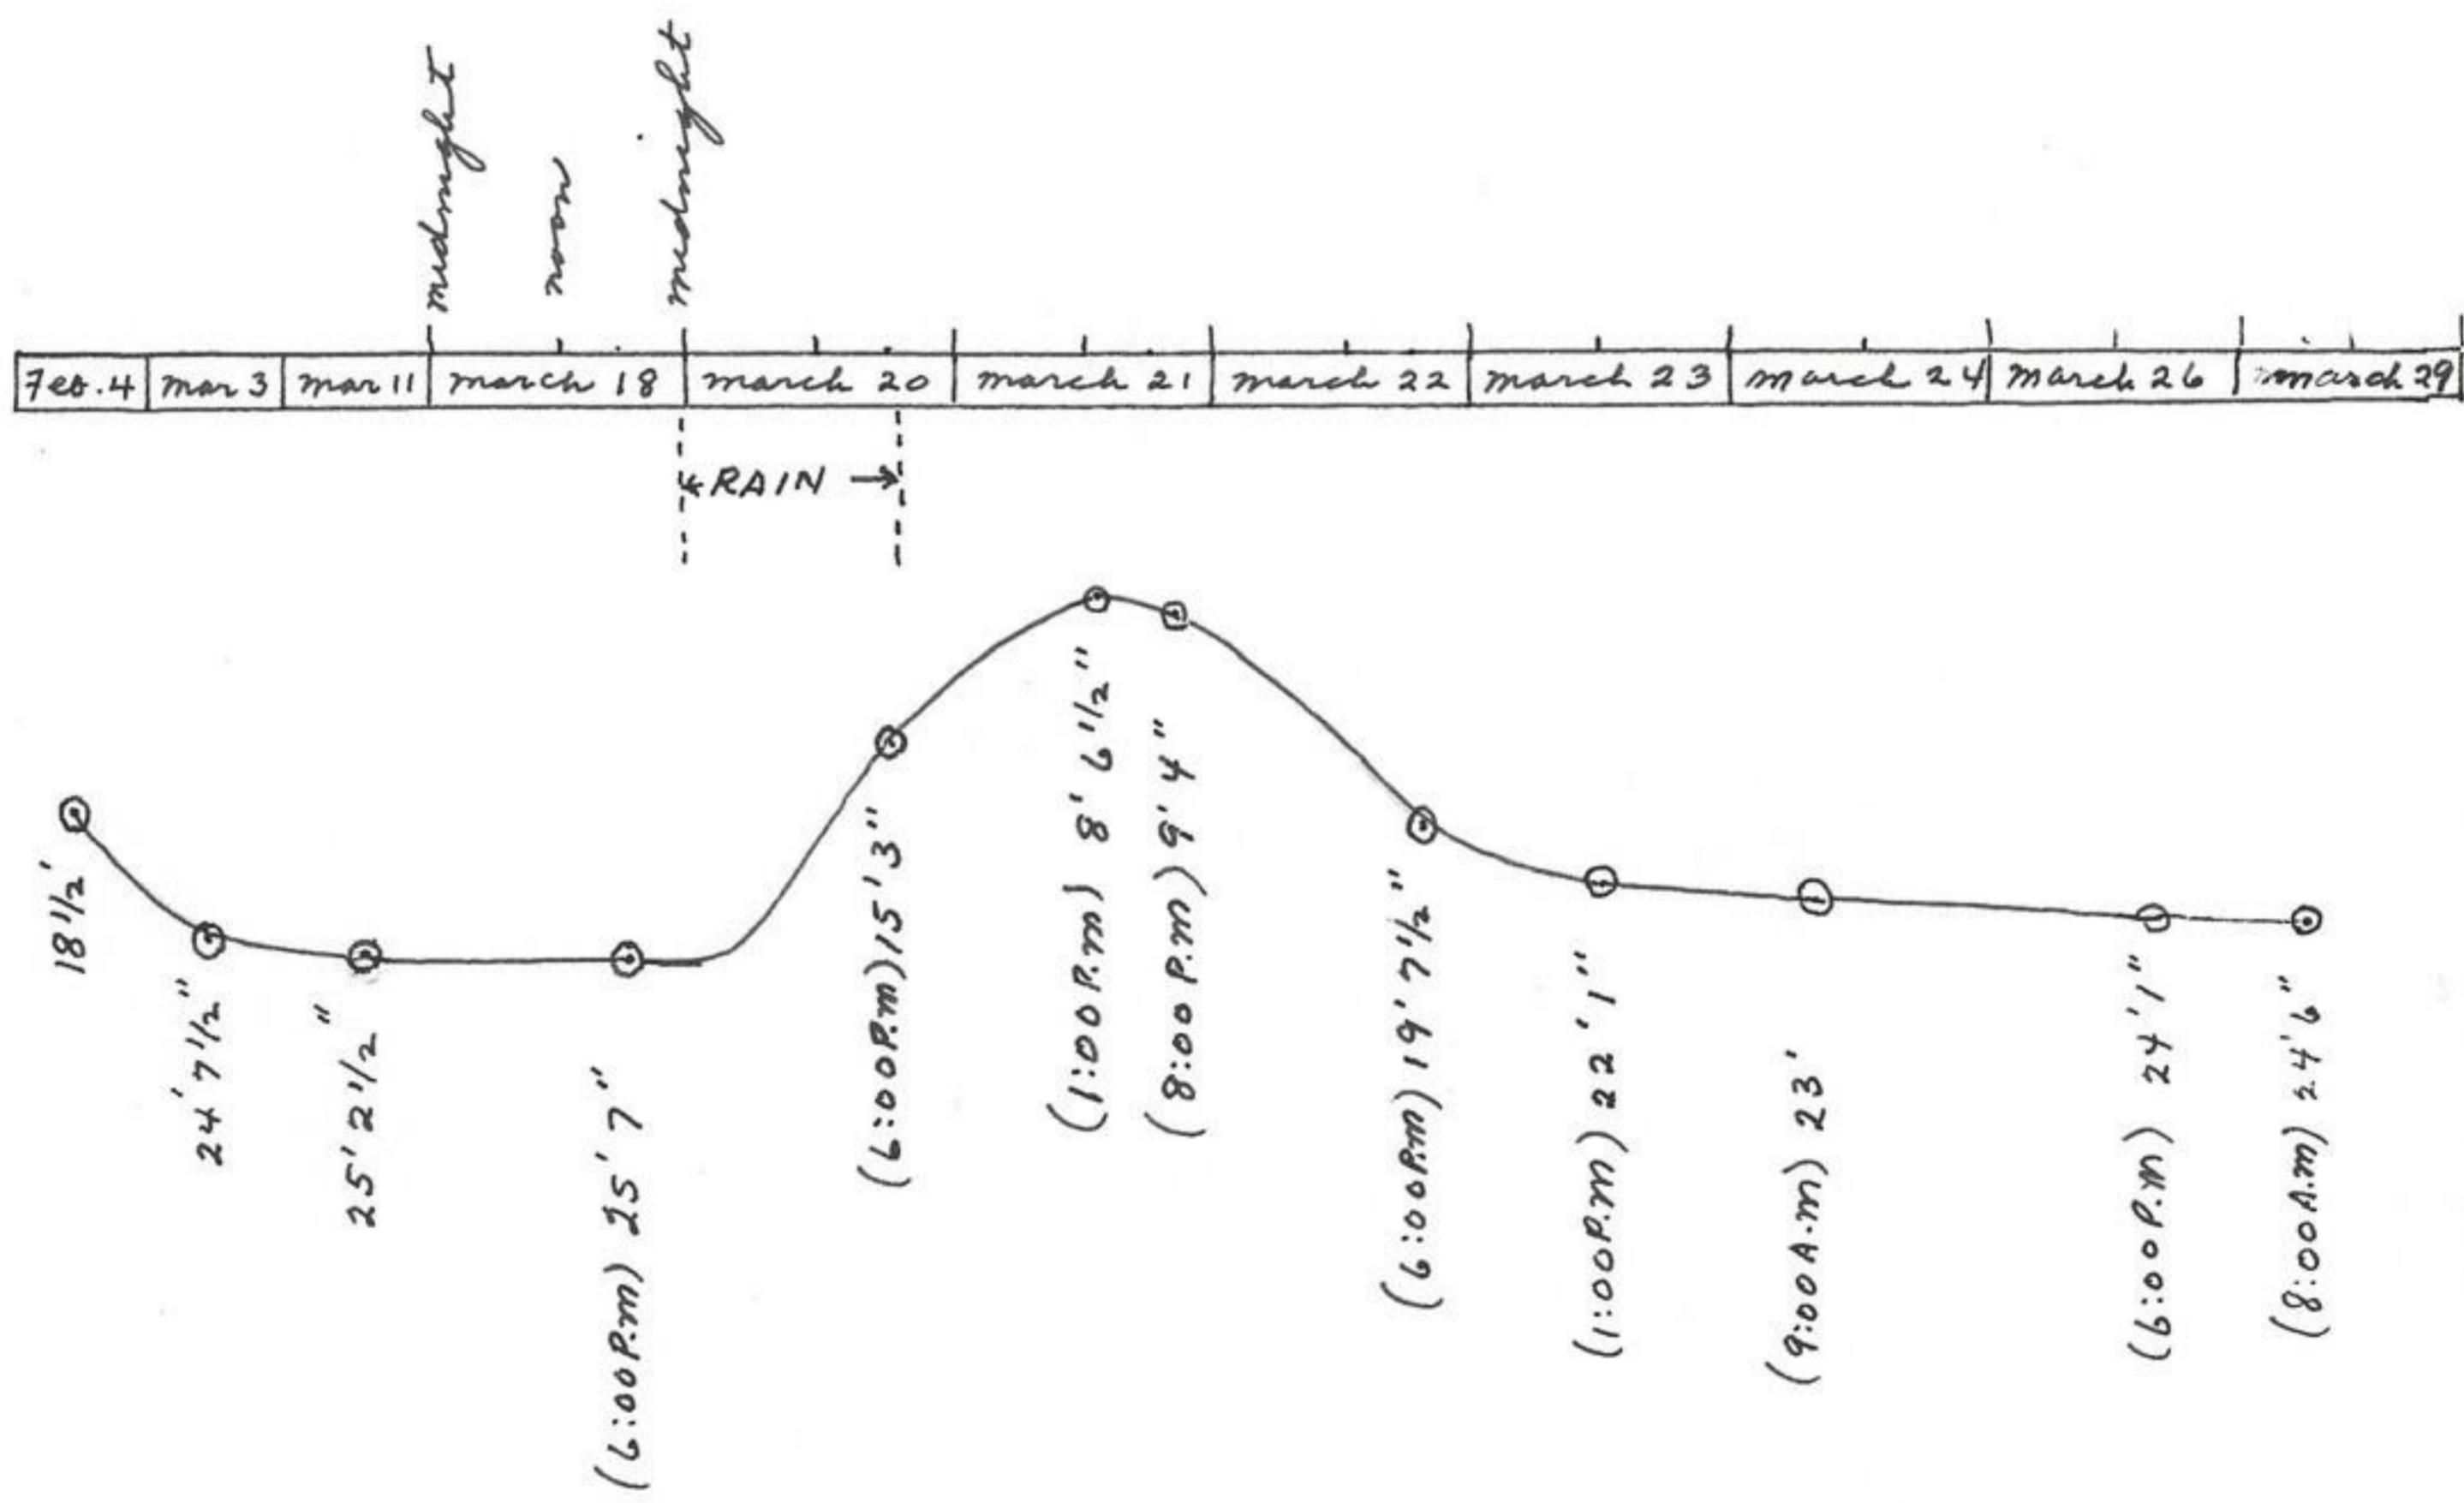

Fox squirrels - 15 singles, 5 pairs. One squirrel crossed over
 river from one side of river to other side. Some pairs chasing each
 other

No butterflies

measured Wakarusa at Lousious Bridge, Lawrence as 25' 7"

The fluctuation of the Wakarusa River is plotted against the few records made this spring. There is a gradual lowering of water in creek after the first major spring thaw when ice and debris moves out of the creek. The first solid rain produced an increase to near flood and then subsided. Crest followed about 18 hours after rain had

stopped. The river at 22' (below bridge) is judged to be a good height for navigation in canoe. At 25' there are too many shallow spots. As late as March 18 there were isolated spots of ice on bank both water level & high flood ice. These ice spots, however, are rare at this time of year.

[See 2 page beyond for March 20, 21, 22, 23, 1962.]

Nashell Bottoms, 4 1/2 mi. S Lawrence, Douglas Co., Kansas

March 23, 1962

This afternoon son James and I collected the following birds from the river and slope adjacent to the river. (* mounted)

- * 620323-1 American Coot ♀ length 370, weight 403gms.
- 620323-2 Tree sparrow ♀ t. length 158, wt 18gms, ovary 4 1/2 mm
- 620323-3 " " " ♀ " " 157, " 17gms, ovary 3 mm length
- * 620323-4 " " " ♀ " " 152, " 19gms ovary 4 x 2 mm

Wakarusa River from U.S. Highway 75 to Richland, Shawnee Co., Kansas.

March 18, 1962

Left Lawrence at 7:25 A.M. at 8:43 at 1 mi E Clinton noted 50 snow geese flying north. One striped skunk road kill. Red-winged blackbirds in large flocks at about 1 flock per mile along the route. No hawk until 1 mi east of Richland and from here to 2 mi. W Richland noted 2 marsh hawks and 3 redtail hawk. No hawks noted beyond to highway 75 S of Topeka. A shrike was clocked at 30 miles per hour. A pigeon at 40 miles per hour. Few horned larks on uplands and the usual small flocks of juncos, tree sparrow, cardinals in definite groups. Early in the morning at near daybreak (last week) there were small sparrows along side of road. Meadowlark common. A few ducks in ponds ^{in canoe} arrived highway 59 at 8:25 where Wakarusa crosses. Departed, at 8:30 A.M. Rained a few minutes at 7:30 A.M. which accompanied an abrupt front but after it passed the day was cloudy and windy all day. In slow water at 8:46 noted an American Coot. This trip of over 15 miles will require almost constant paddling, portaging and leading canoe down rapids so will not make a complete census as I had planned. Census of the great horned owl, red-tailed hawk, fox squirrel woodducks and beaver will be complete. The squirrel count is not as complete because of lack of critical observation. 9:25 fox squirrel. 9:30 left the valley side. Usual winter birds included isolated groups of juncos, Cardinals, chickadees, titmouse & nuthatches. These groups are generally isolated with intervening area without birds. Cardinals now generally distributed all along the route. At 9:35 temp under clouded skies 56°F , water 2 inches below surface of water 40°F , 2 fox squirrels, 1 killdeer overhead. 9:43 limestone ledge of stratified layer dislodged from cliffs on N side, black at edge of water. 3 crows in river bed. 10:00 fox squirrel, 10:05 fox squirrel. 10:12 first great horned owl. 10:15 T.H. owl, 1 fox squirrel. 10:28 1 fox squirrel, 2 fox squirrels together. 10:45 great horned owl, reeftail thrush (could be hermit) in pile of driftwood, also wren. The trees which overhang the river (those injured from high water abrasion, are dropping juice into the water. A few frogs are on bank & edge of river and are jumping into water (Rana pipiens and a small one probably Aeris crepitans). At this time they are about 1 per every block or more. 10:47 along valley side to S. Two black capped chickadees calling - one high and one lower in tone.

- * 620323-5 Song sparrow ♂ 158 mm t.l., 23 gms, testis $1\frac{1}{2} \times 1\frac{1}{4}$.
 * 620323-6 Field sparrow ♂ 135 " " , 15 gms, testis left $2\frac{1}{4} \times \frac{1}{2}$ mm which was the largest of the two.
 * 620323-7 Winter wren ♂ 100 mm total length, tail 28 mm, wt 10 gms. left testis $1\frac{1}{4} \times 1$, right testis $1\frac{1}{2} \times 1$ mm.
 * 620323-8 Fox sparrow ♀ 180 mm total length, 32 gms wt, ovary 3.5 mm square and largest ovaum 1 mm.
 620323-9 Tree sparrow ♀ 155 mm total length, 16 gms, ovary $3\frac{1}{2}$ mm
 620323-10 Black-capped chickadee, ♂ 145 mm total length, 14 gms; left testis 7.2×6 , right testis 6.5×5.5 .
 620323-11 slate-colored juncos. ♀ 150 mm total length, 17 gms wt, ~~testes~~^{ovary} 6 x 3 mm
 620323-12 Harris' sparrow ♀ 180 mm total length, 33 gms wt.

5 blue-winged teal, one american coot and 1 pied-billed grebe in pond at SW corner of Haskell Bottoms ~~1~~ ~~1~~. The blue-wings were in a proportion of 1 male and 4 females. Two shrike on utility line 50' apart, other songles noted. At about 1 mile up Coal Creek we made several observations of note - there are extremely few birds associated with areas of woodland which are flooded and where Pseudacris niger are in full chorus. The sound of these frogs probably keeps other birds away. There are also a lack of buds along the Coal Creek which has just recently overflowed its banks. The best place for sparrow and for juncos are on slopes which have been cut and the brush piled; woodland along overflowing creeks are not prolific in bird numbers. In open field about 1 mi. W of Blue mounds noted 18 wilson snipes, 45 belddeer in water soaked field. The belddeers were in open field and the snipes in short grass part of field. One great horned owl in open field about 2 blocks from woodlands. Several horned larks in some general area. Few Lanius species calling, occasional Oreococcyx but the great majority were Pseudacris and in temporary ponds that I am sure will dry before eggs are hatched or tadpoles complete. This evening, noted about 1000 grackles at Chancellors Home on campus of K.U. These are the first ones noted this season. They have not set up territories across the street from 1620 Town. where they have usually formed a colony of 5 or 6 pairs. Starlings are now using the area & nesting holes.

Louisiana Bridge, Wahoousa, 5 Lawrence, Douglas Co., Kansas
 March 24

water 23 feet below gorder of bridge at 9:00 A.M.

[see page before for dates March 20, 21, 22, 23, 1962 following]

Both the great blue heron and the purple martin were seen by Mr. Kloss this date.

Lawrence, Douglas Co., Kansas

March 20, 1962

Started to rain sometime last night after 10:00 P.M. and continued all day today to shortly after 6:00 P.M. about an inch or so was deposited. At 6:00 P.M. the water was 15 feet 3 inches below the Louisiana Bridge over the Wakarusa River (from top of girder ~~top~~) which is about 10 feet higher than on Sunday March 18 when we made our canoe trip down this river. Many robins in area. *Pseudacris niger* in full chorus. at Haskell Bottoms no *Acris crepitans* calling.

March 21, 1962

At 1:00 P.M. the Wakarusa river was 8 feet 6 1/2 inches below the Louisiana Bridge as measured as above. One American Coot in pond at SW corner Haskell Bottoms ~~top~~.

March 21, 1962

At 8:00 P.M. the water in Wakarusa river was 9 feet 4 inches below the Lawrence Bridge. Measured as about. The crest was reached between 1:00 P.M. & 8:00 P.M. and probably at 1:00 P.M. or very shortly after. The water at the highest point, 8' 6 1/2" at 1:00 P.M. was at base of tree east of the bridge on N side of river. In pond east of Haskell Bottoms noted 4 shovelers & yellowlegs.

March 22, 1962

Drove Dr. Hull from northwestern door to K.C. Airport. Slight rain (about noon). Some small creeks over banks. At 6:00 P.M. the water was 19 feet 7 1/2 inches below the Louisiana Bridge. measured as of March 20 from top of girder. *Pseudacris niger* in full chorus but no *Acris crepitans* calling.

March 23, 1962

At 1:00 P.M. the water in Wakarusa River was 22 feet 1 inch below Louisiana Bridge (measured from girder ~~top~~) water muddy and sides of banks covered with almost pure mud. 2 American Coots in pond at SW corner of Haskell Bottoms and one in roadside ditch. *Pseudacris niger* calling at 1:00 P.M. but not in same volume or chorus as in evening. mating (male clasping ♀) Phoebe nesting and eggs.

March 26, 1962

water 24' 1" below Louisiana Bridge on Wakarusa measured ~~in~~

March 29, 1962

water 24' 6" below Louisiana Bridge over Wakarusa River as measured above. Water relatively clear and with heavy sediment of previous days. Recession lines in mud in last foot day but are about 1 inch apart. Higher on bank the drop is nearer a foot or so. It would be of considerable value to keep an hourly check on fluctuation of water as an expression of the dynamic influence of climate on the drainage system. This information would be of greater value than temp., wind, rain etc as recorded separately. On pond at SW corner of Haskell Bottom (SW Haskell Bottoms refers to pond at junction of Louisiana and Armstrong Roads. ~~10~~ ~~11~~ 5 spoonbills ^{or contiguously} 4 bluewing Rava pipiens laying eggs. Psuedoacris nigrita still in full chorus. Last night there was an abrupt change in the temperature at about 9:45 P.M. from a warm to chilling temperature. Yesterday evening there were 3 pairs of grackles at 1613 Tennessee St in Lawrence. They were in tops of conifers but were not investigating trees as possible nesting sites. These trees are used by these birds every year. This year there are starling nesting in several holes.

Haskell Bottoms, 3 1/10 mi. S and 5 1/10 mi. W Lawrence (P.O.)
Douglas Co., Kansas

March 29, 1962

At 6:00 P.M. noted approx. 275 geese (snows and blues) flying high to NNE. From near pond collected the following:

* 620329-1	grackle	♂	315 T.L. 138 wt. R.teats 6 X 2.9 mm
620329-2	grackle	♀	297 T.L. 124 gms largest testis 5 mm
* 620329-3	swamp sparrow	♂	139 T.L. 18 gms. R.teats 2 X 1.2 L.teats 3.2 X 1.6
620329-4	red-winged blackbird	♀	233 T.L. - 65 gms. testes 2.8 X 1.5
+ 620329-5	fox sparrow	♀	TL. 178 - 35 gms wt ovary 1 mm long.

At 3 1/10 mi. S and 5 1/10 mi. E Lawrence (P.O.) noted several thousand grackles and redwings arriving to roosting grove just east of Haskell Avenue. Water completely inundates ground of grove and gives excellent protection to roosting birds.

4 4/10 mi. S and 2 2/10 mi. E Lawrence (P.O.), Douglas Co., Kansas

March 29, 1962

Collected one phoebe from along Coal Creek:

- * 620329-6 phoebe. ♂ T.L. 175- wt. 23 gms testes 3.3 X 2 right, left smaller
Also noted 1 fox sparrow and 1 swamp sparrow. These two birds

were feeding in a weed patch about 50' ^{from edge of timber} from edge of timber where there was considerable brush and saturated soils and to which they flew when I passed by. They alighted on edge and remained there without the usual concern of man. Time 6:30 P.M.

1613 Tennessee St., Lawrence, Douglas Co., Kansas

March 30, 1962

Three pairs ^(?) of grackles in tops of conifer trees. They were definitely inspecting area for territories or nesting sites. At this time there did not seem to be conflict with the already established starling. A non-migrating bird has the advantage of migrating birds in this case, as the starling have been using this area for the last 2 months, or for a matter of fact, all winter.

Potters Lake, Univ. Kansas, Lawrence, Douglas Co., Kansas

March 30, 1962

Dr. Edward H. Taylor reported that in the early days of his teaching at K.U. he noted a swan on the lake. White pelicans have been frequently seen on this lake, more so in early days than recently.

4 1/2 mi. S Lawrence (P.O.), Douglas Co., Kansas

April 1, 1962

From brush at side of Wakarusa River collected 3 Harris' Sparrows:

62040-1 Harris' Sparrow 185 T.L., 34 gms. ovary 6 mm x 2.8 ♀

62040-2 " " " ♀ 200 T.L., 42 gms. (worms inside ~)

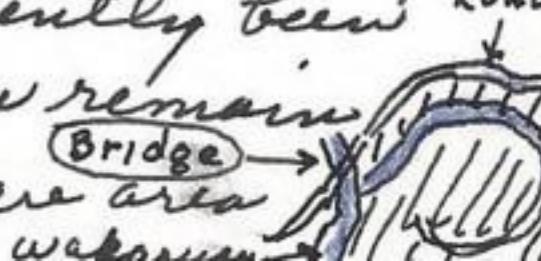

62040-3 " " " ♀ 190 T.L., 41 gms molting over entire body.

Yesterday evening inspected Haskell Bottoms and elsewhere and noted the *Pseudacris* not calling except in dundee's who's call was slow and weak. These few frogs were calling in areas where a few days ago the entire area was a solid chorus of calls. The wind and low temperatures (40° F at 6:30 P.M.) accounted for this condition. Many areas where frogs were calling, mating and laying eggs are now dry. Did not hear *Loua pipiens* or *Acris nigrita*.

Snowed during night between 9:00 P.M Sat., March 31 and Sun morning April 1. On March 31 and April 1 at evening time I found that bird life is scarce (annually) in forested areas.

4 1/10 mi. E and 7 1/10 mi. N Clinton, Douglas Co., Kansas

April 2, 1962

Collected several birds from timbered area in Wakarusa valley NE of Clinton. This area is an old stable land mass surrounded by a high level oxbow drawage. The larger trees have recently been cut and center sections of trees removed & upper limbs now remain as brush piles. This area consists of about 1/5 mile square area 

that is 1/5 mile on each outer dimension. This area is immediately east of the county bridge that crosses the river. The Le Conte Sparrow was from weed patch south of timbered tract.

620402-1	Blue Jay	305 mm t.L. - 100 gms wt., R.T. 6.5 X 4.8, L.T. 8.1 X 5.5
620402-2	Cardinal	218 mm t.L. - 48 gms ♂
620402-3	Red-bellied woodpecker	247 T.L. - 89 gms. R.T. 6.2 X 5, L.T. 7.5 X 5.3
620402-4	Cardinal	213 mm t.L. - 46 gms. ♀
620402-5	Fox Sparrow	178 mm t.L. - 38 gms. ♂
620402-6	Sapsucker	208 mm t.L. - 56 gms, ovary 4.5 mm. fat on body 9 gms and in places $\frac{1}{4}$ inch thick
620402-7	Dawny woodpecker	158 mm t.L. - 25 gms ♂ and solid.
620402-8	Le Conte sparrow	125 mm t.L. - 14 gms ♂
620402-9	Lincoln sparrow	146 mm t.L. - 19 gms ♂
620402-10	Song sparrow	154 mm t.L. - 31 gms ♂
620402-11	" "	155 mm t.L. - 31 gms ♂
620402-12	Harris' sparrow	183 mm t.L. - 42 gms ♂
620402-13	white-breasted nuthatch	144 mm t.L. - 22 gms. ♂
620402-14	Swamp sparrow	135 ^{mm} gms t.L. - 16 gms wt. ♂
620402-15	ruby-crowned kinglet.	112 mm t.L. - 8 gms. ♂
620402-16	eastern phoebe	178 mm t.L. - 25 gms ♂
620402-17	slate-colored juncos.	148 mm t.L. - 19 gms ♂
620402-18	tree sparrow	155 mm t.L. - 19 gms. ♂

Other birds in the wooded area were:

Crow. One concerned as if nesting or on territory.

great horned owl. One, probably nesting in area as it circled area but did not leave

turkey vulture. Pair flew by overhead.

great blue heron. One flying east along N side of valley.

winter wren. A dark wren flew into an erosional gully. This gully was unusual in that the roots still formed a network on surface of ground but gully 8 feet or so deep and four feet wide. The older gully of about 3 feet deep was 20 feet away a parallel to the new one.

The wren flew into this section of the gully and I could not dislodge it. Several good deep meanders of a small creek in this area.

titmouse, bridled. Several singing the entire time I was in area from 2:00 P.M. to 5:00 P.M. On three occasions a ♀ bird flew directly to me from about 200 feet away and lit within 20 feet of me. They remained a few minutes and then continued on. One flew across the Wakarusa River to inspect me.

Robin. 8 in area in loose group.

red-tailed hawk. One on ridge to S.

red-winged blackbird. Small group flew by to S
killdeer. 9 in field to east which was recently plowed.

black-capped chickadee. About 18 in area.

eastern bluebird. One on open slope to south of Wakarusa River.

shrike. In weed patch w of area.

eastern phoebe. One pair in area

meadowlark. In field east of area

horned lark. 4 or 5 in open field east of area.

No starlings in area

pair mourning dove at edge of timbered land.

Few butterflies.

red-billed grebe in Wakarusa.

The Le Conte Sparrow is confined to the grass-weed fields and fles from the center of field to high weeds at edge. It was not seen beyond these limits and is the most characteristic bird of the weed field. The other small sparrows will occasionally enter wooded areas. The field adjacent the river valley sidehills are wet from drainage, probably underground drainage. In timbered sidehill among dry leaves noted several roosting places of small birds. At about 100 feet east of bridge took photo 620402-19 of the Wakarusa River. Green grass on bank showing some growth. The gooseberry bush is the most noticeable green bush in the timbered area. The banks of the Wakarusa has a small frog.

Univ. Kansas Campus, Lawrence, Douglas Co., Kansas

April 3, 1962

13 Bohemian waxwings eating seeds from tree (^(sophora japonicum?) ornamental) on the Chancellors residence. In former years these trees were the favorite feeding grounds for the cedar waxwing. This year I have only seen the Bohemian waxwing in the area.

4 1/2 mi. S Lawrence, Haskell Bottoms, Douglas Co., Kansas

April 3, 1962

Collected the following birds near Wakarusa River:

- * 620403-1 meadowlark ♂ 242 mm t.L - 129 gms R testes 12.2 x 6.8, L + 11.8 x 6.7
- * 620403-2 song sparrow ♀ 153 mm t.L - 24 gms ovary 2 mm
- * 620403-3 " " ♂ 149 mm t.L - 24 gms testes 1.8 x 1.5 mm
- * 620403-4 Lincoln sparrow ♂ 137 mm t.L - 16 gms L testes 1.9 x 1.2, no right testis
- 620403-5 eastern phoebe 162 mm t.L - 21 gms ♀
- * 620403-6 juncos. ♀ 145 mm t.L - 20 gms ovary 3.9 x 3.4

After the sun went down the meadowlarks were perched on small weeds about $\frac{1}{2}$ foot above grass level. They were generally distributed and were calling in a very soft toned song. At a bridge, which was only $2\frac{1}{2}$ feet above the water, two eastern phoebe were sitting nearby. They both flew under when approached and when a rock was dropped into the water they both left. The female 620403-5 was collected.

Dightman's Crossing, Wakarusa River, Douglas Co., Kansas
NE $\frac{1}{4}$ NE $\frac{1}{4}$ sec. 14, T. 13S., R. 20E.

April 3, 1962

Took 4 colored photographs of Wakarusa River showing massive Tonganoxie Sandstone member of Stranger Formation. Light poor and about 4:00 P.M. Photo 620403-7 from W side of river and showing formation and wood debris up creek. Photo 620403-8 from E side and beyond bend up creek from main group. Three trees and cliff. Photo 620403-9 of erosional pattern and rocks in foreground shooting up river and about middle of exposure. Photo 620403-10 of formations shooting down creek.

2 $\frac{3}{10}$ mi. N and 1 $\frac{1}{2}$ mi. W Lawrence, Douglas Co., Kansas
(P.O.)
 April 4, 1962

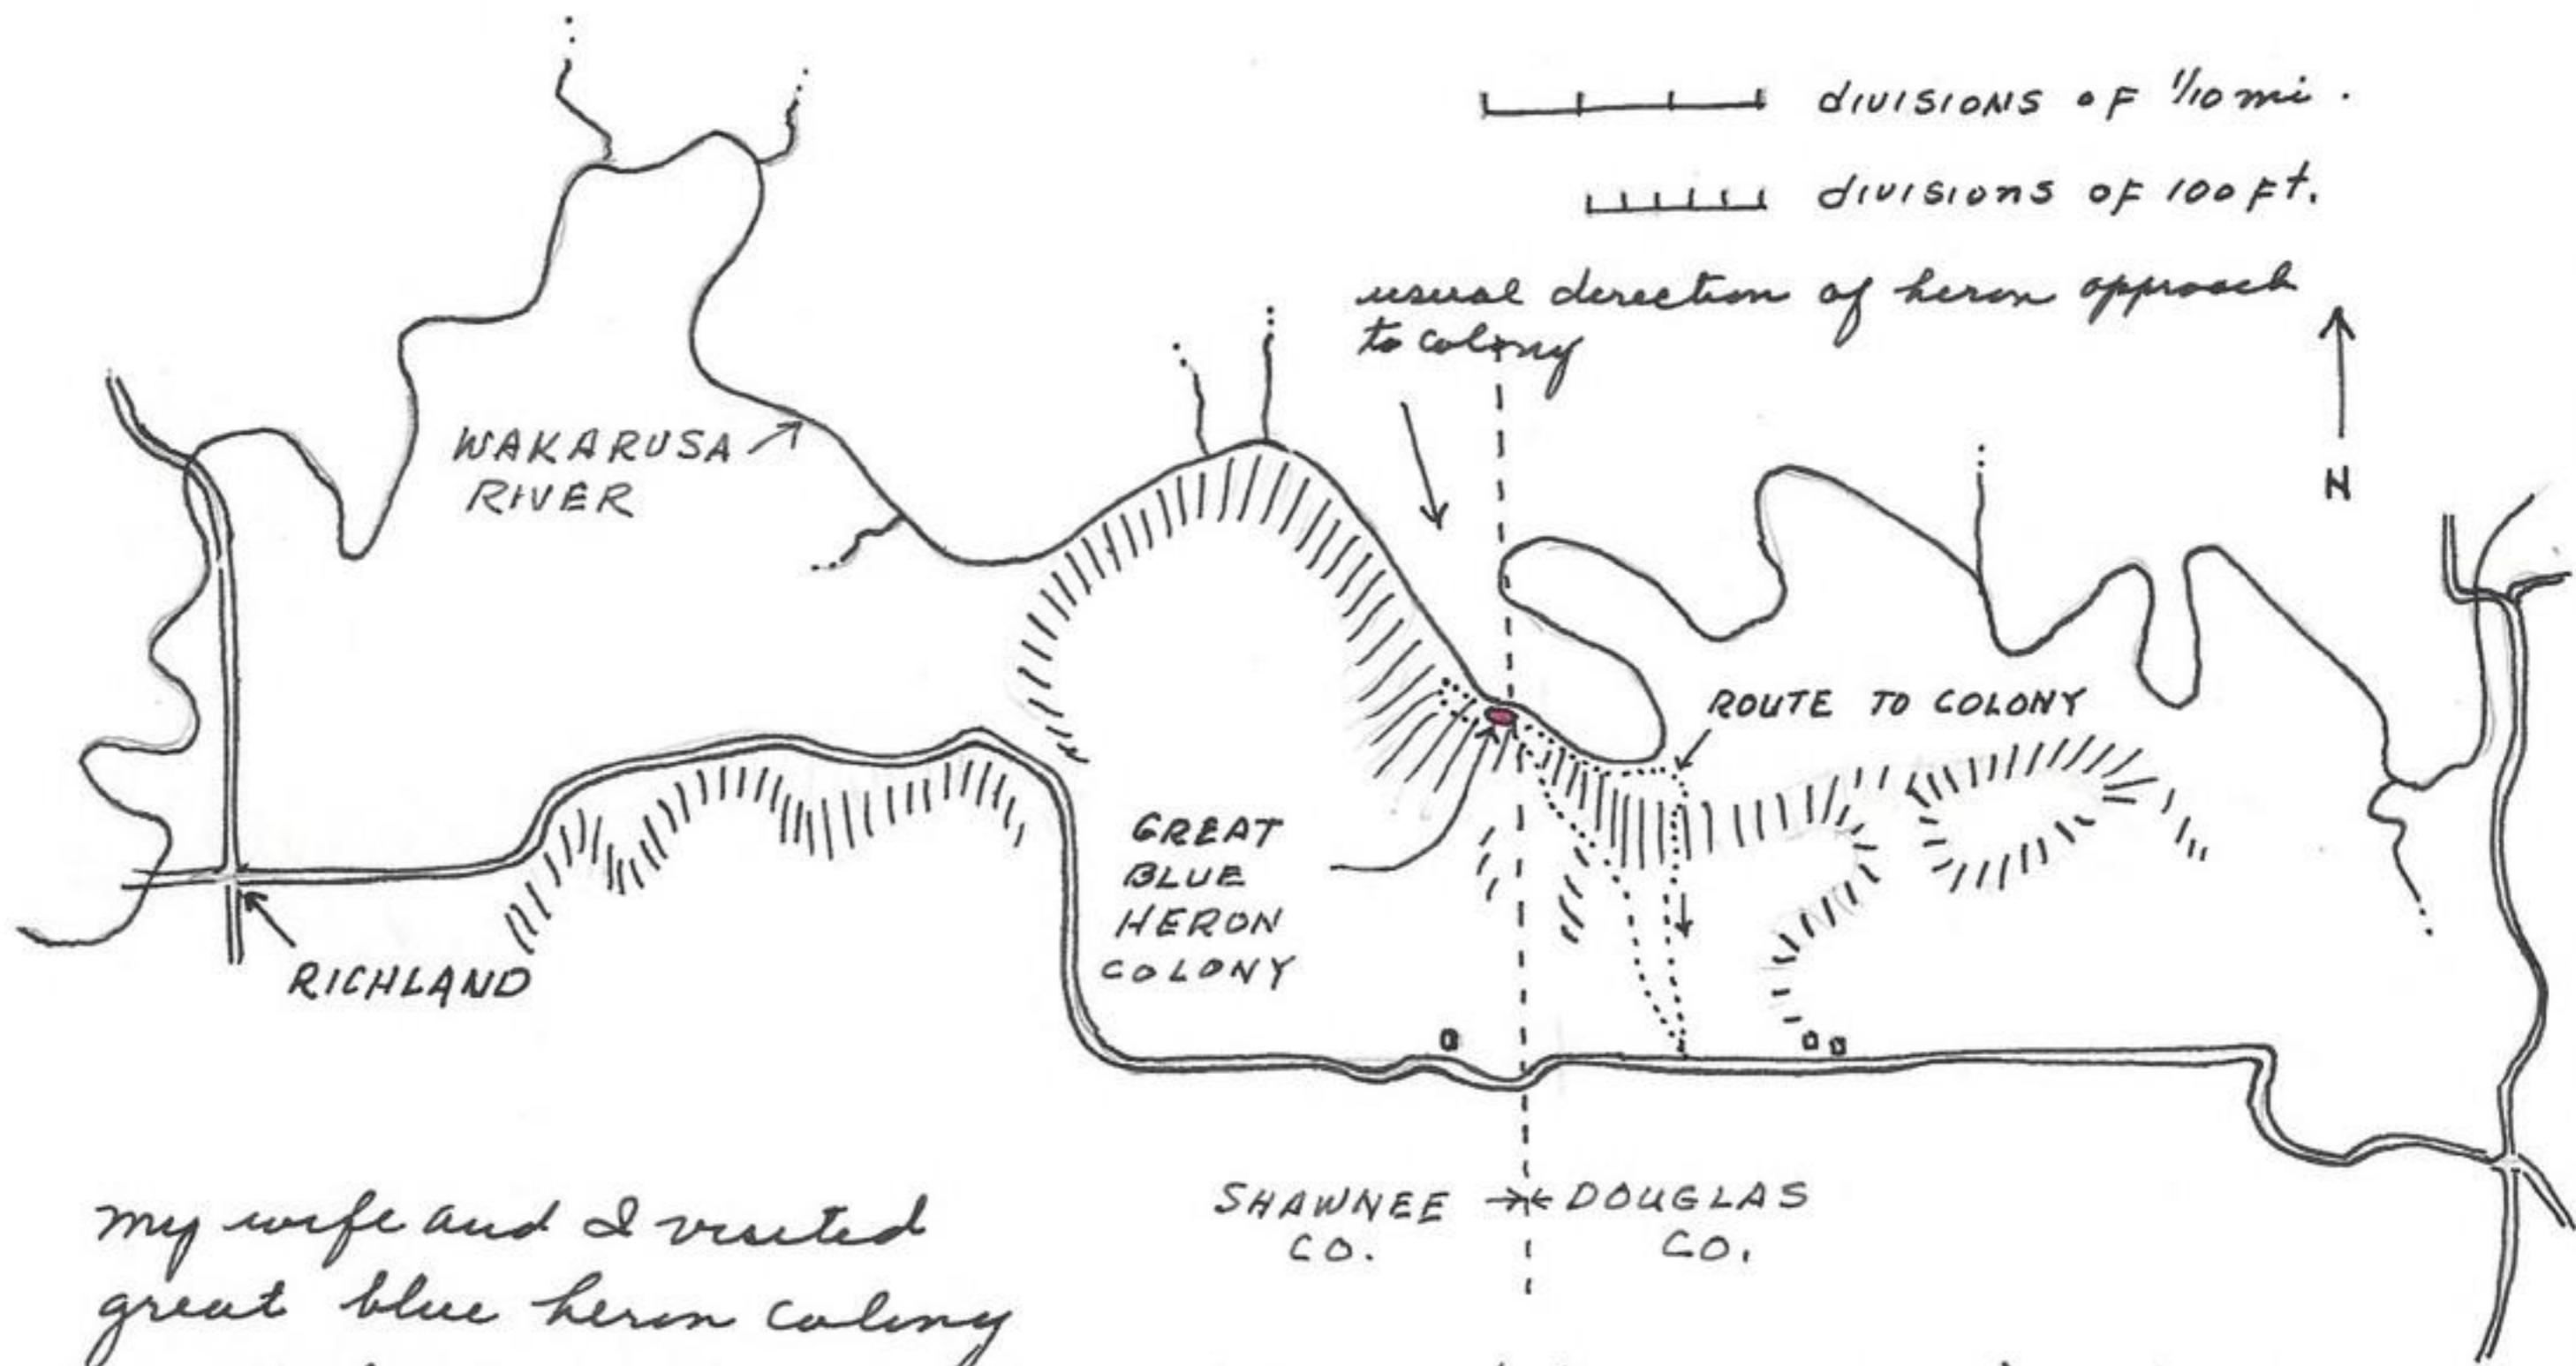

From along Atchison-Topeka-and Santa Fe railroad between Kansas Power & Light Co and Caltex Chemical Co collected the following birds:

- 620404-1 Cardinal ♂ 208 mm t.L., 48 gma., R.T. 2.8 x 2.3, L.T. 3.7 x 2.2 mm
 - 620404-2 song sparrow 160 mm t.L., 24 gms.
 - 620404-3 " " 160 mm t.L., 24 gms ♀
 - 620404-4 Lincoln sparrow 138 mm t.L., 19 gms ♀
 - 620404-5 Vesper sparrow 153 mm t.L., 29 gms. ♂
 - 620404-6 slate-colored sparrow 152 mm t.L., 23 gms. ♂
 - 620404-7 Oregon junco 152 mm t.L., 19 gms. ♀
 - 620404-8 brown creeper 130 mm t.L., 10 gms ♂
 - 620404-9 eastern bluebird 170 mm t.L., 37 gma R.T. 8.7 x 6.0, L.T. 9.0 x 5.0 mm
- The most favorable place for sparrow is in tall 8 feet high weeds (dry straight stalks) associated with small bushes. No tree sparrows in area. Lincoln sparrows generally on ground along wet course among sparse willows or trees. They keep close to the ground.

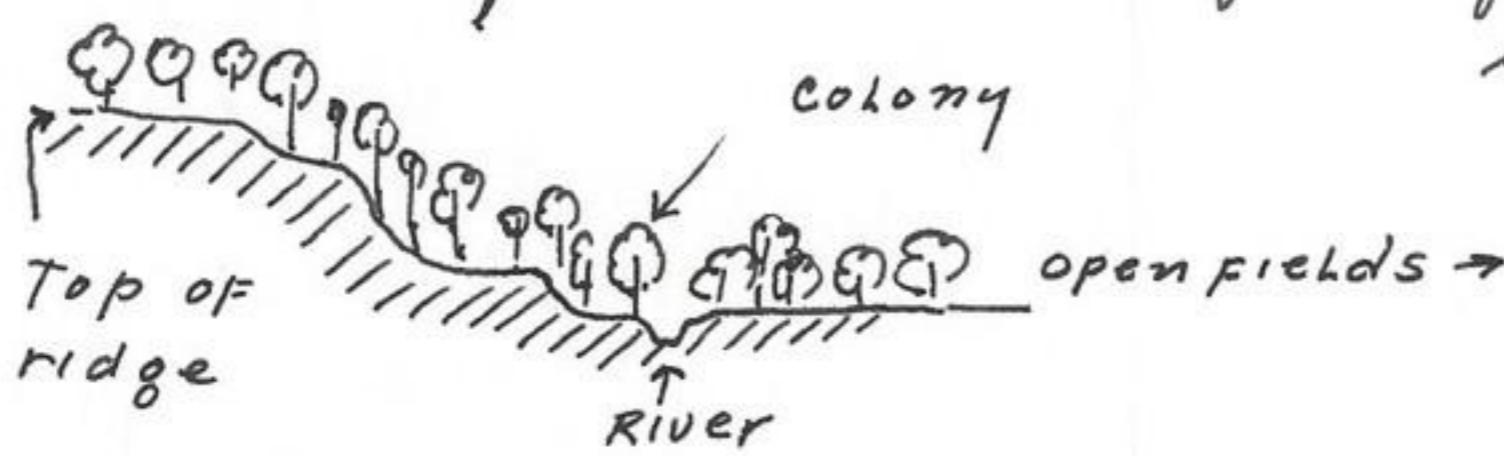

2101 Vermont St., Lawrence, Douglas Co., Kansas
 April 4, 1962

Set Pierson killed a screech owl near his home. He had seen it before this season. 620404-10 Screech owl 222 t.L., 147 gms. wing sp 551 mm. tertis 8.6 x 6.8 mm. rest, 9.3 x 7.4 mm. left. tertis black brw.

1 4/10 mi. E and 600 ft. N Richland, Shawnee Co., Kansas
April 5, 1962

my wife and I visited great blue heron colony on Wakarusa River east of Richland. (3:00 - 4:00 P.M.). Colony of 26 nests in sycamore trees at edge of river (S side). This colony is on the south side of the valley and at base of hillside which is 140' high. The largest sycamore had 16 nests, a second

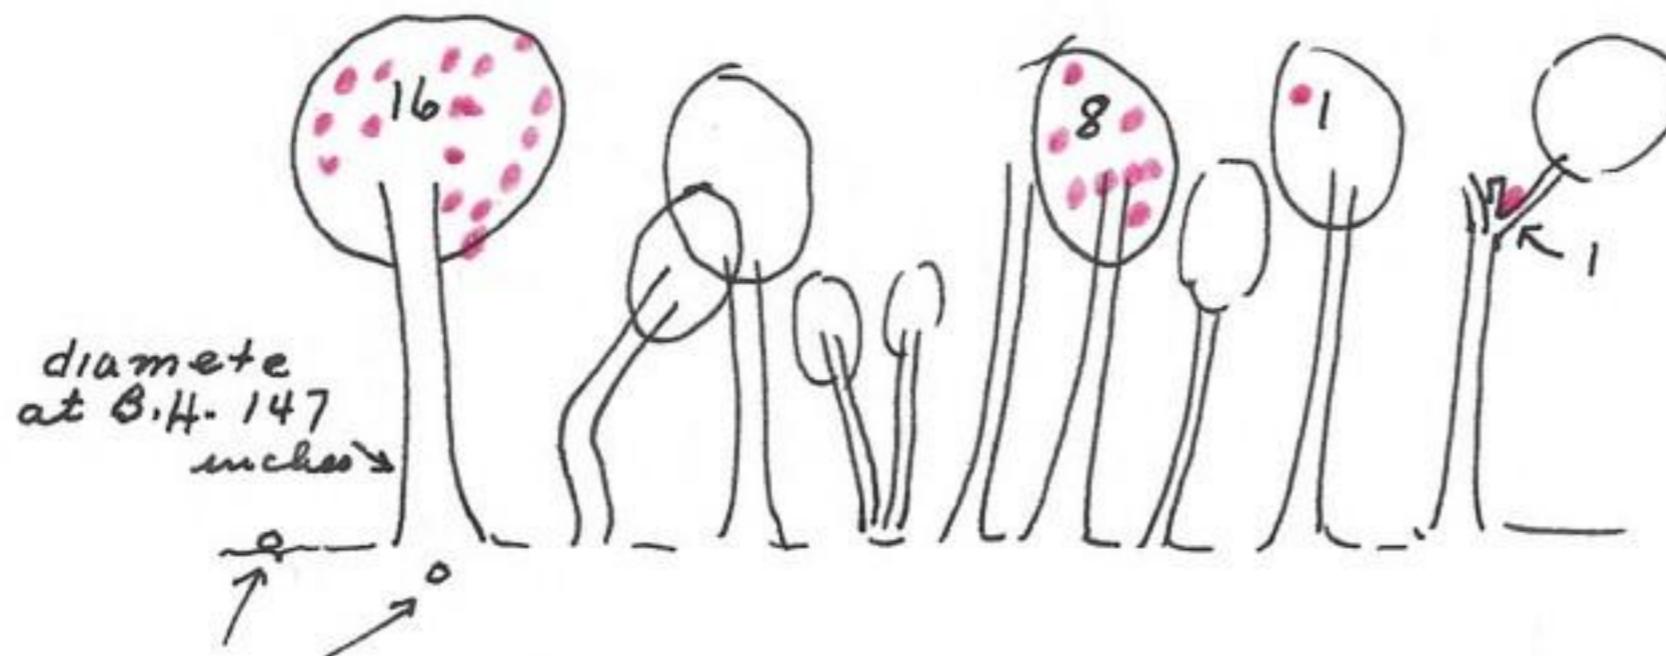

stems in cratch as if being constructed.

sycamore 8 nests which is 2 more than note on a previous trip (see), a third sycamore with 1 nest and a fourth with a few nests mainly on outer limits of branches.

(and 2 feathers)
Element, under nests covering about 40 percent of ground surface and thin in surface, indicate that the colony had not been in use for very long. 2 fragments

diameter at B.H. 147 inches
of eggs with yellow yolk stains under largest tree (probably fresh). One bird remained near nest while all others kept away from the colony while we were under trees. Birds that approach to then flew away were generally from the NW or N. Occasionally a bird would give a deep but not too audible squawk.

The birds returned to nests after we left. On approach we counted 18 birds leaving the colony at one time. This area should be posted but people could view colony with binoculars from vantage point on ridge to south. There did not appear to be any unusual association of other kinds of birds with the colony. Three turkey vultures were noted flying over colony on three occasions but they did not seem to be concerned directly with the colony. On plateau above ridge (near ear) the *Merostes achaogaster* had completely utilized a closer field during winter. Runways were in all direction and seemed to have been used when wet. Some trails appeared to be recently used but in about a block of searching did not see any animals. Coyotes and skunks? had excavated many underground nests. While at colony photographed the nests in the largest tree from 55w of tree 620405-1, one photo of nesting tree from about 150 feet up creek 620405-2, and a third general view of creek from colony showing Wakarusa River to west. 620405-3. Tracks of heron were uncommon in mud near colony - numerous racoon along river, however. The gooseberry and small hickory? were most noticeably in beginning foliage (gooseberry) or bud (hickory). Other tree did not show conspicuous budding or leaves. From near Lechland collected a killdeer 620405-4 from a pond along side of road. Also noted 1 yellowlegs and 3 Wilson Snipe from another drainage pond in Wakarusa river valley near Clinton. measure of killdeer: 620405-4 ♂ Killdeer 251 T.L. - 100 gms - L testis 5.0 x 4.3, right testis 9.6 x 3.3 (heavier end posterior 0).

4 3/20 mi. S and 400 ft west Lawrence (P.O.), Douglas Co., Kansas

April 7, 1962

Took 2 photographs of Wakarusa River S of Haskell Bottoms showing cliff outcrops 620407-1 and small creek that enters from S 620407-2. These same kinds of cliffs are exposed down river near Louisiana Bridge. In this area collected the following birds:

620407-3	Savanna sparrow	132 T.L. - 20 gms. ♂
620407-4	" "	132 T.L. - 20 gms. ♀
620407-5	Titmouse	157 T.L. - 25 gms. ♂
620407-6	Oregon junco	155 T.L. - ¹⁹ / ₂₃ gms. ♂
620407-7	Vesper sparrow	149 T.L. - ²⁸ / ₃₇ gms. ♂

Wakarusa River at Louisiana Street 25 feet 8 inches below girder of bridge + water relatively clear.

Mouth Wakarusa River, Douglas Co., Kansas

April 8, 1962

Collected the following birds from near mouth Wakarusa River on S side:

- | | | |
|----------|------------------------|------------------------|
| 620408-1 | Cardinal | 225 mm T.L. - 48 gms ♂ |
| 620408-2 | Oregon juncos | 149 mm T.L. - 18 gms ♂ |
| 620408-3 | black-capped Chickadee | 131 mm T.L. - 12 gms ♀ |
| 620408-4 | goldfinch | 120 mm T.L. - 11 gms ♀ |

James Robert, Robert Person and Richard Hemphill made canoe trip from Haskell Ave Bridge to Bridge N of Eudora. James & Richard stopped at Slightman's Crossing. They noted one dead beaver. measured a cottonwood tree on S side of Wakarusa near mouth at 21 1/2 feet at 3 feet high $\frac{1}{4}$ in.

3 1/2 mi. S and 1/2 mi. W Lawrence (P.O.), Douglas Co., Kansas

April 14, 1962

Collected the following from pond at side of road in Haskell Bottoms:

- | | | |
|----------|----------------------|---|
| 620414-1 | wilson snipe | 275 T.L., 120 gms ovary 14 mm long,
largest ovum 3 mm in diameter |
| 620414-2 | American coot | 278 T.L., 600 gms. testes ^{right 9.1 x 6.2}
_{left 9.3 x 6.0} |
| 620414-3 | Red-winged blackbird | 238 T.L., 65 gms ♂ |
| 620414-4 | " " | 231 T.L., 62 gms ♂ |

3 1/2 mi. S and 2 7/10 mi. E Lawrence (P.O.) Douglas Co., Kansas

April 14, 1962

Collected the following birds and mammals from along the creek:

- | | | |
|----------|---|---|
| 620414-5 | Sciurus niger | 177 total length, 45 gms ♂ |
| 620414-6 | " " | 525 " " 600 " ♀ This female
and young from nest of dry bark shreds and leaves from
locust tree (completely thorny and would have been impassable to
climb.) nest 12 feet high and ledge in cratch and thorny
branches. The above young was the only one in nest. Eyes
not open. These young of the squirrel are difficult to kill by
heart pressure. nest  open fields |
| | 20 feet from open field
and 40 feet from creek | nest creek |
| 620414-7 | Harris sparrow | 192 T.L. 35 gms ♂ |
| 620414-8 | " " | 189 T.L. 38 gms ♂ |
| 620414-9 | Downy woodpecker | 170 T.L. 27 gms ♀ |

620414-10 eastern bluebird 173 T.L. . 30 gms ♂

620414-11 black capped chickadee 136 T.L., 12 gms ♂

In field 1 block of creek collected 2 horned lark in open plowed feed.

620414-12 Horned lark 186 T.L., 31 gms ♂

620414-13 " " 180 T.L., 30 gms ♂

3 1/2 mi. S and 3 mi. E Lawrence (P.O.), Douglas Co., Kansas
April 15, 1962

Collected the following bird from fence line. Open fields on both side of road. Nearest trees $\frac{1}{2}$.0 mi to SW. The bird was very confiding and allowed ear to approach to within 20 feet. This habit of sitting on fence lines within easy shooting distance may be a factor in keeping the population down.

620415-1 scissor-tailed flycatcher. 325 T.L., 42 gms testis
Right 6.0 x 4.3, left 6.4 x 4.0.

4 2/10 mi. S and 3 mi. E Lawrence (P.O.), Douglas Co., Kansas
April 15, 1962

From brush along small drainage entering Wakarusa River shot the following birds ~~open field~~ ^{open} ~~open field~~ ^{open} ~~drainage~~ ^{open} ~~drainage~~

620415-2 lark sparrow 165 T.L., 29 gms ♂

620415-3 white-throated sparrow 175 T.L. - 27 gms ♂

620415-4 fox sparrow 174 T.L., 37 gms ♂

620415-5 bluebirds 175 T.L., 33 gms.

620415-6 Harris' sparrow 192 T.L., 35 gms

620415-7 " " 178 T.L., 36 gms ♂

620415-8 w-b. nuthatch 145 T.L., 20 gms ♂

620415-9 swamp sparrow 140 T.L., 15 gms ♂

620415-10 white-throated sp. 170 T.L., 26 gms ♂

620415-11 lark sparrow 168 T.L., 28 gms ♂

Camp, Univ. Kansas, Lawrence, Douglas Co., Kansas
April 21, 1962

Noted chimney swifts on campus for first time this year. They were in small numbers compared to summer population.

April 24, 1962

Noted 2 pairs of starling copulating (6:00 P.M.) at residence, 1620 Tennessee, Lawrence.

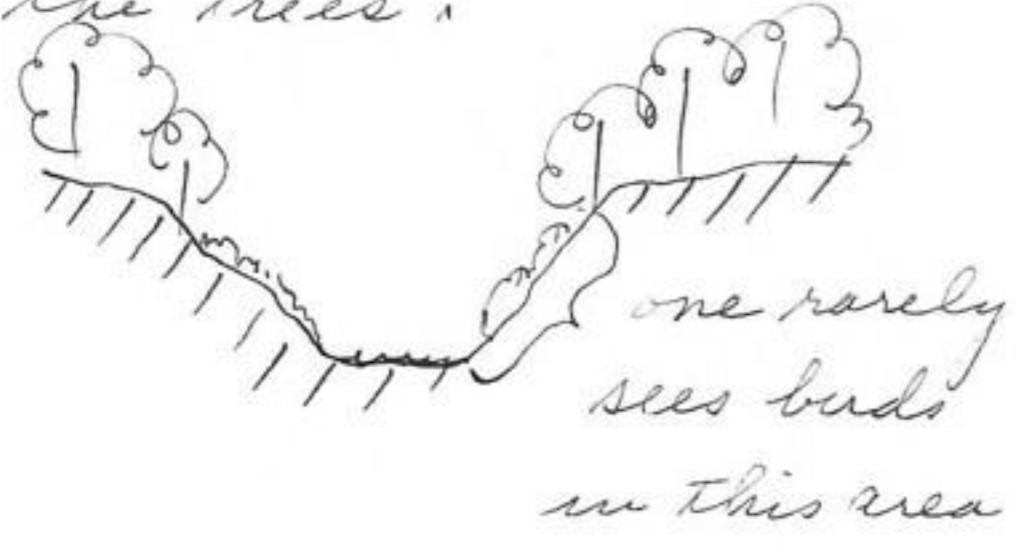

13/20 mi E and 3/4 mi N Clinton, Douglas Co., Kansas

April 28, 1962

Son James and I made canoe trip down Wakarusa River from bridge at locality above N.E. of Clinton to next bridge down river about $4\frac{1}{3}$ miles by river and $2\frac{1}{5}$ miles by straight line. Collected the following birds:

620428-1	Savanna sparrow	138 mm total length, 17 gms wt ♀
620428-2	" "	132 mm t.l., 16 gms ♂
620428-3	Harris' sparrow	172 " " " , 33 " . ♂
620428-4	field sparrow	142 " " , 12 " . ♂
620428-5	Myrtle warbler	140 " " , 12 " . ♂
620428-6	" "	140 " " , 13 " . ♂
620428-7	Spotted sandpiper	177 " " , 40 " . ♀
620428-8	white throated sparrow	172 " " , 30 " ♂

There is a real scarcity of birds in creek vegetation proper, that is the area between the edge of creek and the edge of the trees.

The ground is covered with small trees and few weeds and soil generally bare and muddy when wet. This is the zone of flood waters when creek is flooded. Most of the birds are in big trees.

Collecting is not satisfactory be-

cause of the inconvenience of climbing steep bank and then the thick weeds (stinging nettle) where birds fall and are not recoverable. We did not see beaver or muskrats or usual signs of raccoon activity, and we believe that these animals have changed location or their numbers have been reduced by poaching and hunting dogs. We noted 1 dead beaver in debris about 8 feet above present level of creek and one at present level of creek, both small and probably of last year's animals. James Robert (son) told me that last week he saw 1 dead beaver (large and whitish in color) between Haskell Bridge and Slichtman's Crossing.

In Wakarusa River valley in open fields we noted and heard duckcups but we did not find them on uplands where in former years they were numerous. There was a noticeable lack of fox squirrels along a route where earlier in the season there were many. Earlier in the season during breeding they are conspicuous whereas at this time of year with young in nests, they are very inconspicuous.

3 3/10 mi. E and 8/10 mi. N Lawrence (P.O.), Douglas Co., Kansas

April 29, 1962

Collected the following from area of pond and from timber along mud Creek about a 1/10 mi. East of the pond. This area is bordered by extensive cultivated field of river bottoms:

620429-1	Bronze grackle	320 mm t.L., 134 gms	♂
620429-2	Lincoln sparrow	139 "	14 " ♂
620429-3	Savanna sparrow	138 "	20 " ♂
620429-4	Downy woodpecker	162 "	32 " ♀
620429-5	Warbling vireo	138 "	11 " ♂
620429-6	Orange-crowned warbler	115 "	9 " ♀
620429-7	Baltimore Oriole	191 "	34 " ♂
620429-8	Dickcissel	175 "	30 " ♂
620429-9	Horned lark	180 "	33 " ♀
620429-10	White Crowned Sparrow	179 "	34 " ♂
620429-11	Pelot black snake	1140 mm body length, 232 tail length	
620429-12	Thamnophis	420 mm body length, 108 tail length	
620429-13	<i>Cognatus</i> <i>Bufo compactus</i>	45 mm total length	

This toad was taken from the stomach of the Thamnophis above. The hind feet and parts of the legs were eaten.

The snake was resting on top of a tree stump 2 feet above the ground with area of toad on uppermost part of stump and head lowered. It appeared as if it was taking advantage of the sun's rays for digestion purposes.

Toad eaten front end first. The time collected was 11:45 A.M.

620429-14 *Sceloporus*
old R.R. grade.

From under rock on

The downy woodpecker 620429-4 was one of two in process of copulation. One little green heron on mud Creek. The blue jays in the city of Lawrence, have for the last week and a half, been traveling in groups of 2-6 and calling continuously. I believe they are organized for hunting eggs and small birds. The same kind of hunting organization is also taking place in areas removed from the City. There is a definite correlation between arrival of small birds from the south and the appearance of leaves on the trees which has occurred in the last week.

noted a female fox squirrel working slowly along branch about 4 feet from two nests of dried leaves which probably supported young of the squirrel.

This afternoon son James Robert and two of his friends made a canoe trip on Wakarusa River from Haskell Bridge to Eudora. Time 4 hours. They saw only one muskrat, no beaver except one dead (whitish pelage). Last week they noted 1 great blue heron, between Haskell Bridge and Dixitmans Crossing.

They capsized twice, once because of one of them springing from edge of canoe to shore causing the two other individuals to shift weight in opposite direction. The boat turned over in the direction of the shift of weight. The other time was when one man was in canoe on back end beyond seat  and when canoe was pulled up on land (front end) the high point of gravity turned the canoe over.

The dickcissels are common in cultivated fields of riverbottom (alfalfa) and are singing. Many males in outer edge of trees bordering these fields; others singing from telephone lines, small bushes and tops of weeds.

Lawrence, Douglas Co., Kansas

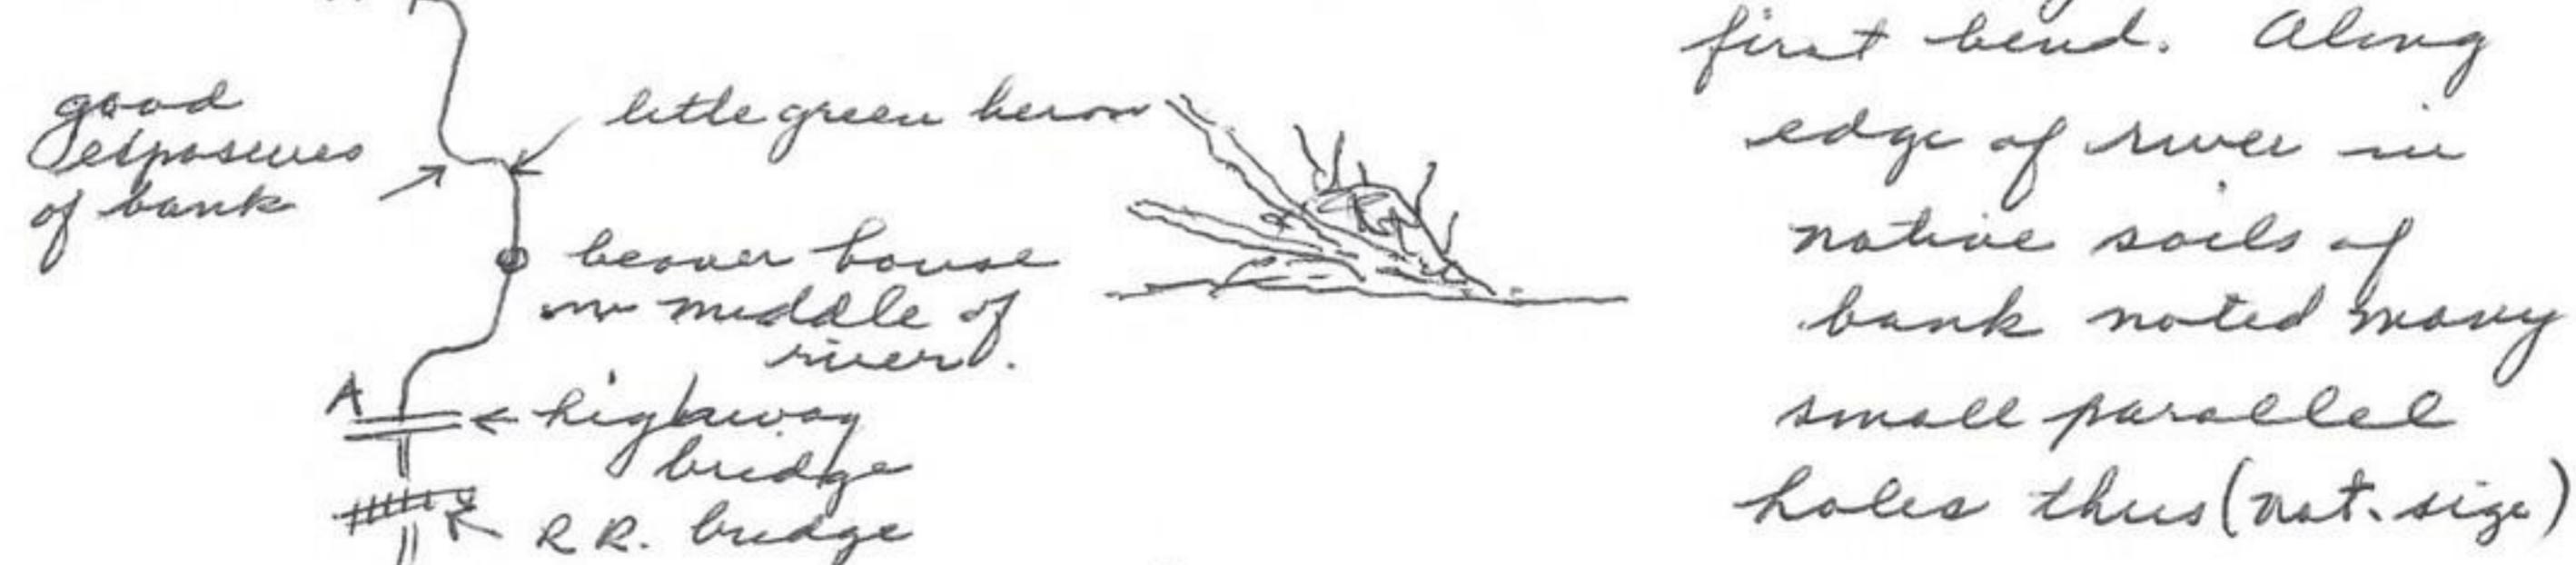

May 4, 1962

There was a noticeable falling of the seeds of the elm  today. The ground had accumulated masses, especially under trees. Collected a *Scodopelia* 620504-1 on campus at K.U.

Delaware River, Perry, Kansas

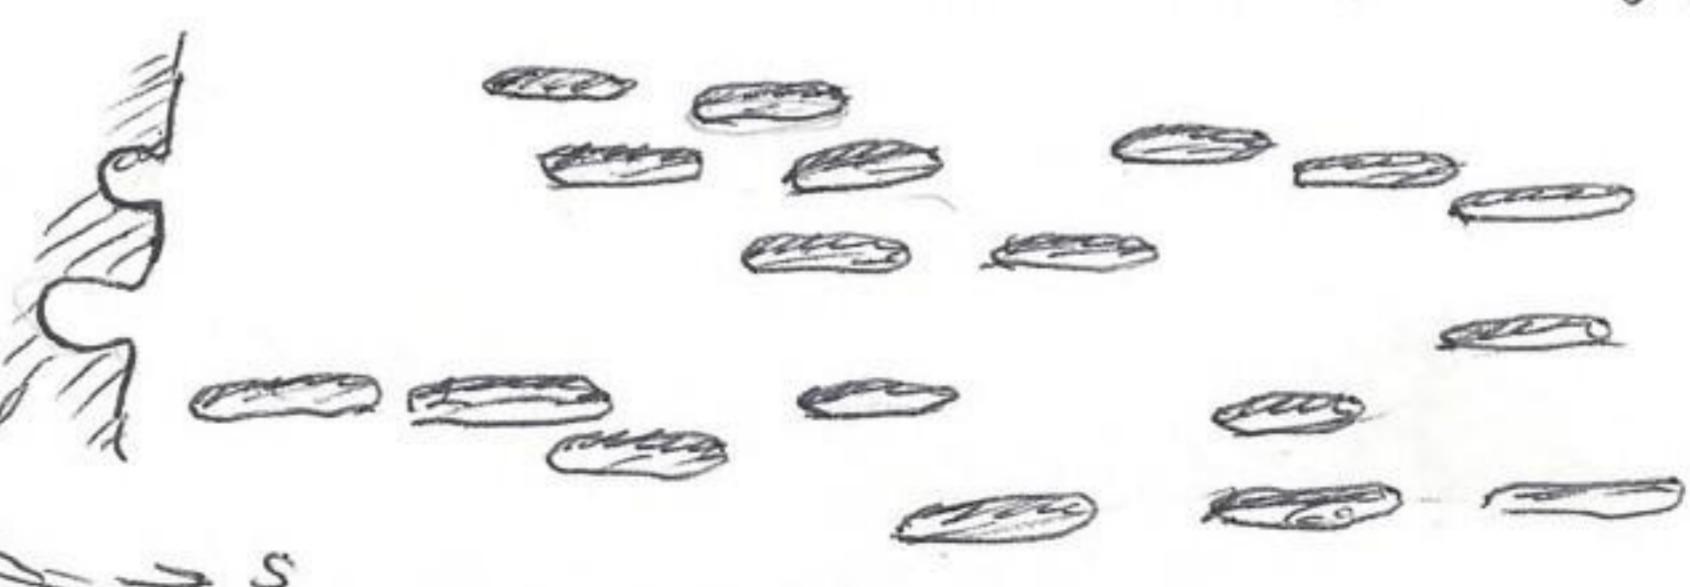

May 6, 1962

Son James & I made canoe trip up river from highway bridge to second bend (A-A') One eastern kingbird at first bend. Along

edge of river in native soils of bank noted many small parallel holes thus (nat. size)

They were shelf-like and did not penetrate soils. Forest beds dipping to S or in trend of river

Noted about 20 frogs along bank. When canoe is close to land they will jump into side of canoe rather than into water. One fisherman caught a 14 inch channel catfish on trout line set. One set line held a red fox which was caught by the foreleg. The fox apparently was attempting to get at the bait or fish when caught and was drowned. Few *Aris crepitans* calling (4:00 P.M.).

3 3/10 mi. E and 8 1/10 mi N Lawrence (P.O.), Douglas Co. Kansas

May 7, 1962

Collected the following birds from around interurban pond:

620507-1	Orchard Oriole	wt. 23 gms.	♂
620507-2	" "	166 mm t.l., $\frac{26}{27}$ gms	♀
620507-3	warbling vireo	142 mm t.l., 14 gms	♂
620507-4	Savanna sparrow	132 mm t.l., $\frac{17}{18}$ gms	♂
620507-5	Dickcissel	159 mm t.l., 30 gms	♂
620507-6	"	166 mm t.l., 31 gms	♂
620507-7	"	165 mm t.l., $\frac{30}{31}$ gms	♂
620507-8	"	165 mm t.l., $\frac{29}{28}$ gms	♂
620507-9	Savanna sparrow	140 mm t.l., $\frac{21}{22}$ gms wt	♂

One pair of eastern kingbirds at pond and remained in area. At $1\frac{1}{2}$ mi. n + $1\frac{6}{10}$ mi. E Lawrence (P.O.) at a point across street to n from Bismarck School noted one *Citellus franklinii* enter one of two holes in den area. It had crossed street from east when first observed. Except for a few 1 foot high weeds, there was no vegetation on ground. This area was formerly a processing plant which was destroyed by tornado several years ago. $\frac{1}{2}$ nest of squab. The soil was composed of material of disintegrated cement and building material.

Bismarck School

May 7, 1962

Robert Pierson presented me with the following material from above locality:

620507-10 Copperhead body 232 - tail 44

- 620507-11 Timber rattler total 950, body 850, buttons 48,
500 gms wt.
- | | | |
|------------------|---------------------|------------------------------|

May 10, 1962

Robert Pierson presented me with the following snake:

620510-1 Blue racer 642 body, 175 tail, 90 gms wt. From
above locality.

Lawrence, Douglas Co., Kansas

May 10, 1962

Noted nighthawks over buildings in town, some of the birds were chasing each other only a few feet above ground between buildings. These are the first birds observed this season.

Haskell Bottoms, 4 1/2 mi. S Lawrence (P.O.), Douglas Co., Kansas.

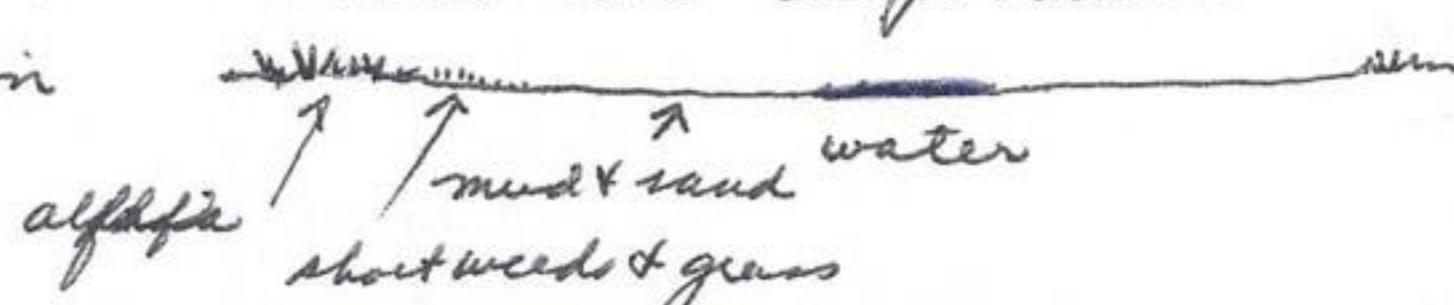

May 11, 1962

Collected the following herps:

- | | | |
|-----------------|---------------------|-------------------------------|
| <u>620511-1</u> | Natrix | 690 body - 83 tail - 170 gms. |
| <u>620511-2</u> | Coluber Constructor | 631 body - 195 tail - 118 gms |
| <u>620511-3</u> | Eumeces obsoletus | 112 - 120 - 40 gms |
| <u>620511-4</u> | Eumeces obsoletus | 112 - [95] - 37 gms. |

1 8/10 mi. N and 1 6/10 E Lawrence (P.O.), Douglas Co., Kansas

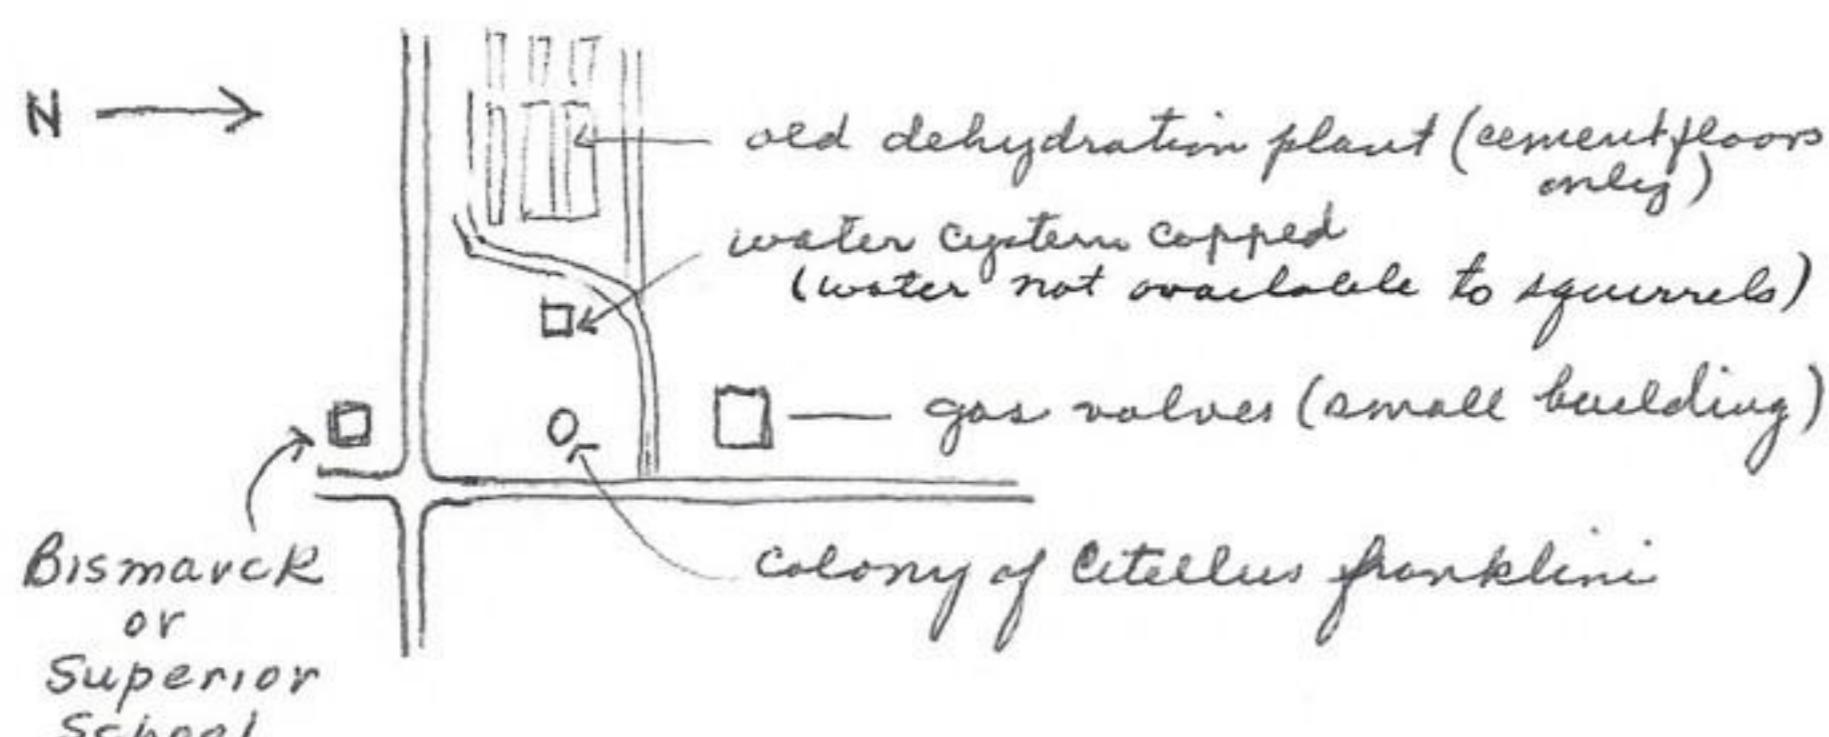

May 12, 1962

In old meander course of Kaw in river valley noted the following birds: 5 black tern, 4 wilson phalarope, 4 blue winged teal (2 pairs), male & female killdeer and the young about 3/4 size adult, and 4 kinds of sandpipers probably pictoral, Baird, western & least. I could not be positive about the kinds. Cross section 

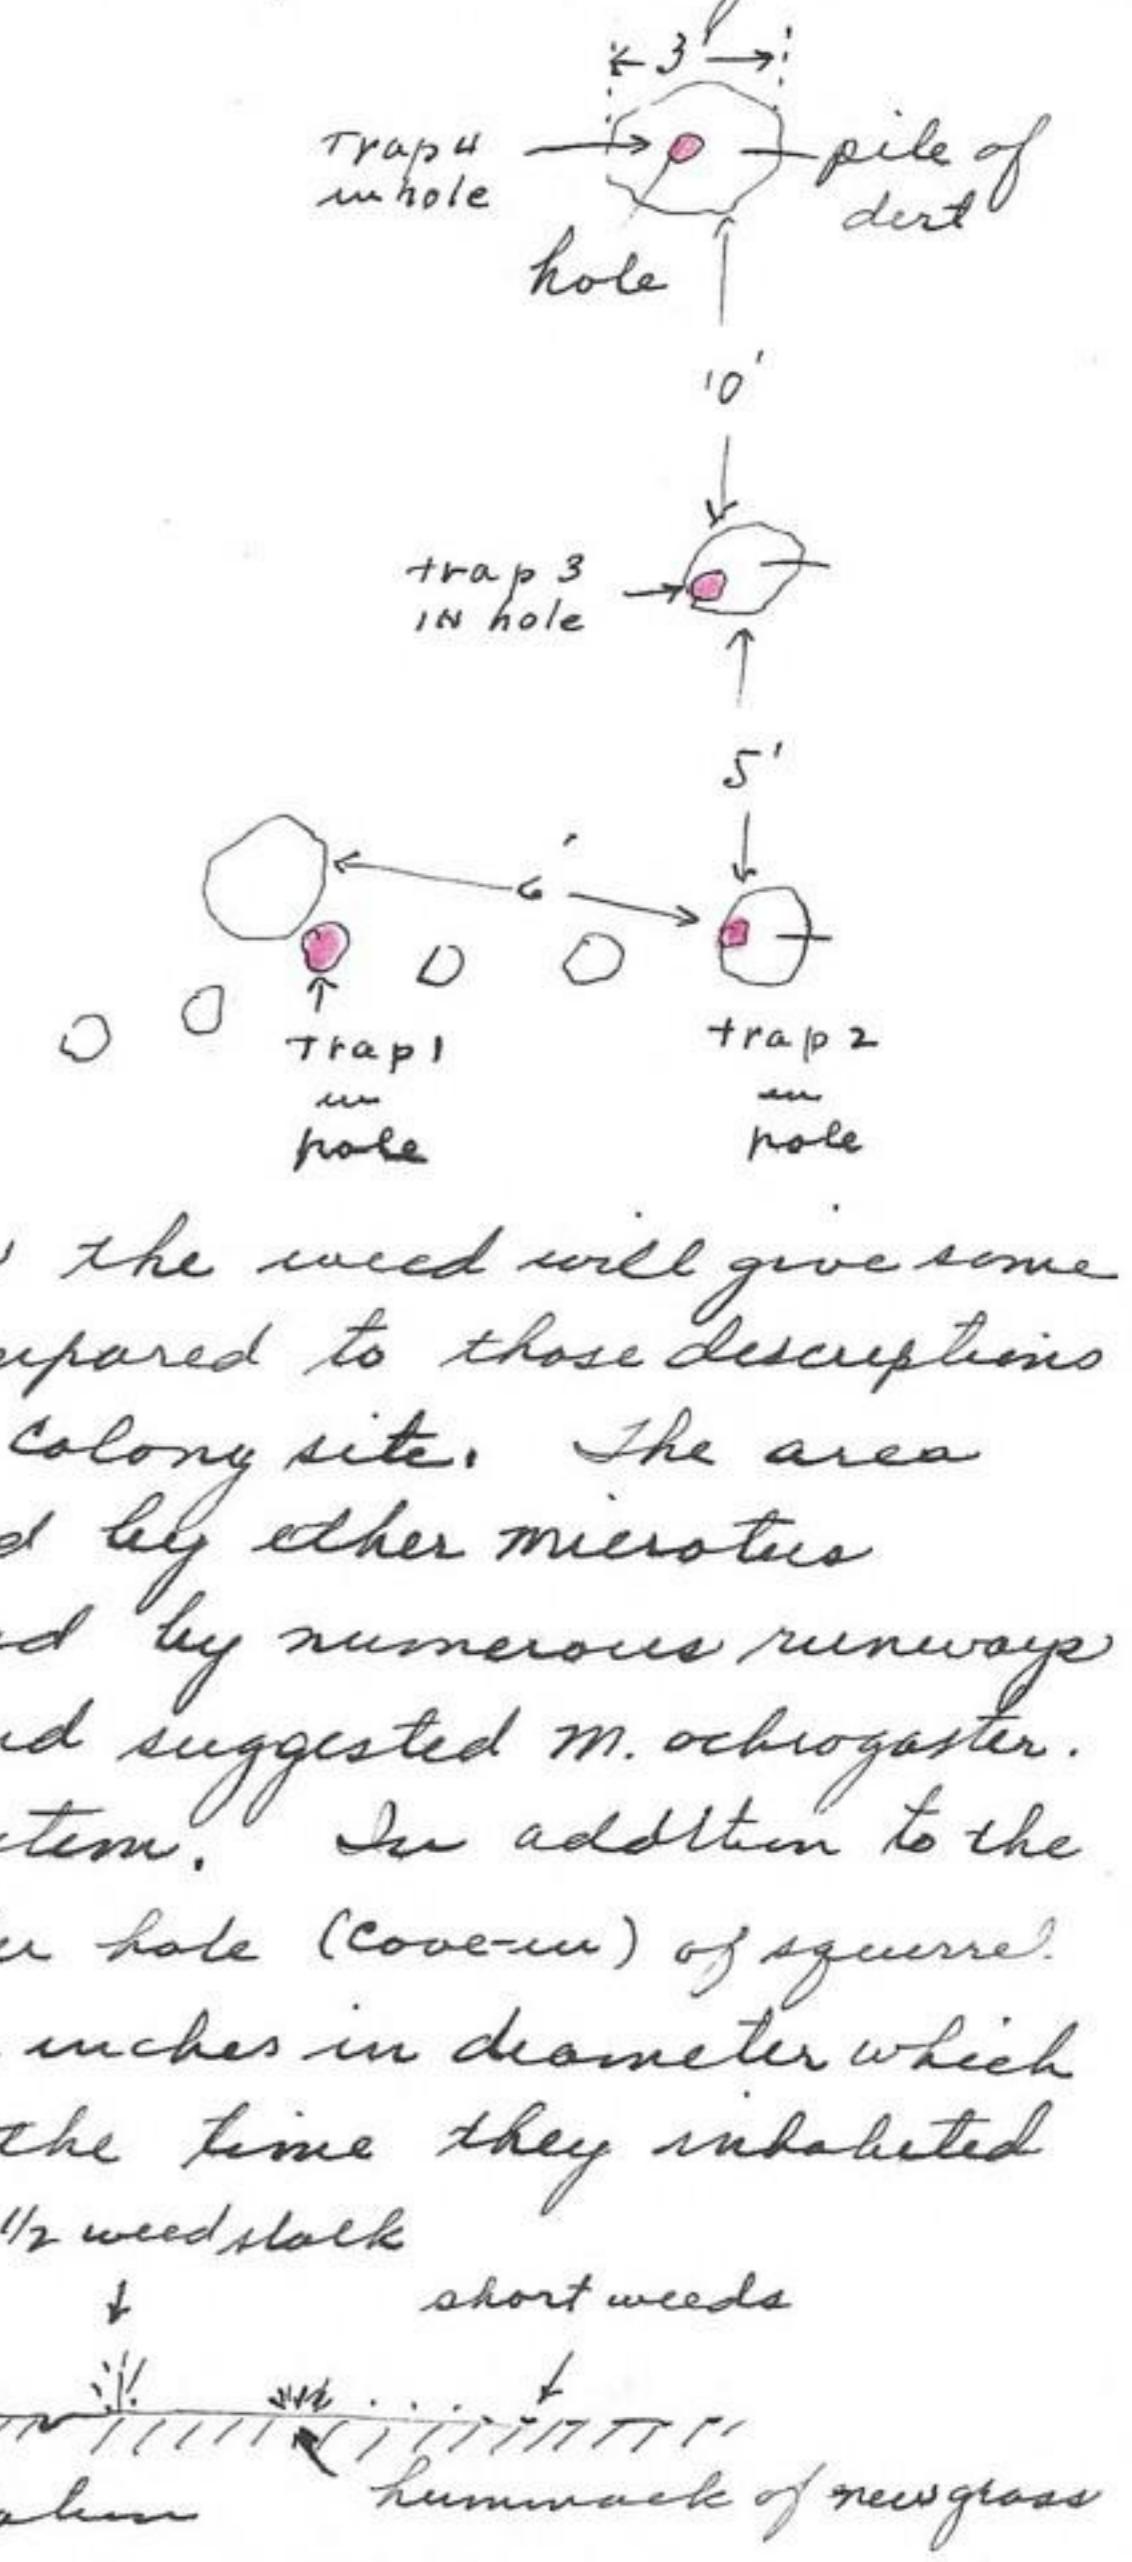

1/2 mi. N and 1 4/10 mi. E Lawrence (P.O.), Douglas Co., Kansas
May 12, 1962

At 10:00 A.M. set four no. '0' steel traps in area where I observed a Franklin ground squirrel (See notes May 7, 1962). The colony

of 4 major holes was 50 feet from road to east, 100 feet from road to south and 50 feet from service road to N. This area was at one time a dehydration

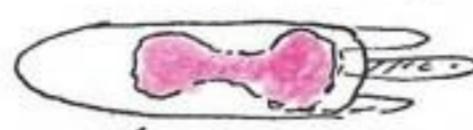

plant which processed alfalfa. Several years ago a tornado completely destroyed the plant except cement foundations and floors. The immediate area of the colony is now bare ground except a few weed stalks about 1 1/2 to 2 feet high and some grass bunches about 3/4 foot high. Other low ground weeds cover the area but only sparsely. For all tense and purposes the colony is in an open and exposed situation where all holes can be seen at a distance. One week earlier the vegetation (grass) was even smaller and more sparse. Later in the season the weed will give some protection to the colony but nothing compared to those descriptions of plant community completely hiding colony site. The area had previously been extensively used by other microtus ochrogaster or Segnodon as evidenced by numerous runways in area. These runways were deep and suggested M. ochrogaster. The dens were part of the runway system. In addition to the 4 holes with dirt there were several other hole (cover-h) of squirrel size and several small hole about 1 1/2 inches in diameter which were used by the small rodents at the time they inhabited the site.

From this colony collected the following *Citellus franklini*:

620512-1 *Citellus franklini* 405-140-60-18-550 gms testis 27 mm

This male squirrel was from trap placement no 2 and was taken between 10:00 and 12:00 A.M. The skin of this animal was as difficult to remove from body of any *Citellus* I have ever prepared. The fascia and connective tissue between the skin and muscles had to be separated with scalpel. The entire back of animal was scar tissue, particularly on rump area and shoulders . The skin on rump was almost solid scar tissue and with depth, of about $1\frac{1}{2}$ mm. thickness. The tissue was differently colored yellow, brown, white. It is apparent that these squirrels fight among themselves at an accelerated tempo. This colony produced 4 males and no females. It was appear that these squirrels meet at a common fighting ground which is not immediately associated with the denning site of the female. This squirrel called while in trap.

620512-2 *Citellus franklini* 399-147-56-18-430 gms testis 25 mm

This squirrel was from trap no. 1 and like above was taken between the hours of 10:00 - 12:00 A.M. The back of this squirrel was also heavily scarred but not to the same degree as the older male above. Two of the wounds had hemorrhaged beneath the skin in the rump region; wounds that could have been made by other squirrels while the animal was in the trap. There were a few scars on venter. The skin was not as difficult to remove as the skin of no. 620512-1 above.

620512-3 *Citellus franklini* 391-147-56-17-430 gms testis 25 mm.

This squirrel was caught ^{in trap} between 12:00 noon and 5:00 P.M. The animal was dead and the front trap leg was in trap and cleaned of flesh. The body was eaten into lungs and heart at region of leg attachment. Puncture wounds in chest and thoracic region and on rump had penetrated body cavity and had hemorrhaged beneath the skin and internally; a clear case of cannibalism among *Citellus franklini*. The body had not been removed from side of trap.

620512-4 *Citellus franklini* 397-146-56-16-480 gms. testis 25 mm.

Caught from trap 4 between 6:00 P.M and 8:00 P.M. Three puncture wounds penetrated body cavity and had hemorrhaged. Animal dead in trap as result of these wounds.

The four traps were left in position the following day (checked 8-12-6 o'clock) and the morning of the third day without results.

It is noteworthy that this colony supported only males and that these squirrels will kill each other if they become defenseless. It is probable that extremely old aged males who are not capable of defending themselves are eliminated by the younger males. It is also interesting that a colony would not support females. Because of the commotion of fighting of males which would attract predators, the females are probably removed to some adjoining area.

Lawrence, Douglas Co., Kansas

June 2, 1962

The young starting left nest box today. These were the young of the pair noted copulating April 24, 1962 (see notes of that date).

Lawrence, Douglas Co., Kansas

June 5, 1962

The young of June 2 observation have not been seen since they left the nest. Today the adult female was carrying nesting material into the box and soliciting the male by extended and slowly vibrating wings.

2 1/10 mi. E of Big Springs (Highway 10), Douglas County, Kansas.

June 11, 1962

noted a scissortailed flycatcher ^{flying} out over highway to pick ^{up} an insect out of the air and then return to fence post.

1 7/10 mi. W and 1 2/10 mi. N Leavenworth, Douglas Co., Kansas

June 11, 1962

From this point along A.T. and Santa Fe railroad to a point 1 mi. west counted 4 ^{Dusky} Lazuli bunting. The wooded bluffs to south are the least disturbed and most extensive along the Kaw Valley between Lawrence and Topeka. This area would make an excellent natural area.

Lawrence, Douglas Co., Kansas

June 11, 1962

I have noted many bluejays, probably young of the year, feeding on insects on the ground. They are more confiding in man at this season of the year than at other times.

These young birds and other preying birds, are vulnerable to attack during the learning process of foraging.

In June 4 a red-headed woodpecker arrived at home (1620 Tennessee St) and remained until today. It called frequently. This species is rarely seen in this area.

Lawrence, Douglas Co., Kansas

June 17, 1962

Two young of blue jay on ground and unable to fly. Nest in tree above.

5 3/4 mi. S on Louisiana St., Lawrence, Douglas Co., Kansas

June 18, 1962

noted 8 cottontail rabbits in groups of 3-1-1-2-1 at edge of road (1 block). Time sundown. Other areas near Lawrence also supported rabbits in greater numbers than last few years. Two of the 8 above were adults. From the above area picked up a road kill:

620618-1 yellow-billed cuckoo, T.L., wt.

Lawrence, Douglas Co., Kansas

June 19, 1962

Jefferson Brokler presented me the following:

620619-1 Chimney Swift 136 T.L., 22 gms wt. It had entered a room via a fireplace. ♂

620619-2 Am. Robin. no measurements

1116 Helltop Drive, Lawrence, Douglas Co., Kansas

June 20, 1962

Jefferson Brokler presented me the following:

620620-1 Cuckoo, yellow-billed 295 T.L., 72 gms wt.

620620-2 " " " 268 T.L., 53 gms wt.

5 3/4 mi. S and 1 1/4 mi. W Lawrence, Douglas Co., Kansas

June 27, 1962

Red-wing blackbirds with nest of eggs, young 3/4 grown and empty nest.

1325 W 19th St., Lawrence, Douglas Co., Kansas

June 27, 1962

Mr. C. S. Edmonds presented me with the following bats:

620627-1 *Lasiurus borealis*, ^{red bat.} 108- - - - - 41.7 gms ♀

This ♀ had 2 young which measured:

620627-2 *Lasiurus borealis* 80- - - - - 8.2 gms

620627-3 " " 81- - - - - 8.4 gms

At 6:00 A.M. Mr. Edmonds noted this bat flying under a tree at his home. At the same moment a pair of robins flew at the bat and struck it in the air. The bat and its two attached young dropped to the ground with the robins in pursuit. The birds acted the same as if a cat had been in the area. The female protects her young by expanding dorsal area of back and interfemoral membrane. At times she will lie on her back. The young, although separated in box, will find mother for attachment & feeding.

Tonganoxie Lake, Leavenworth Co., Kansas

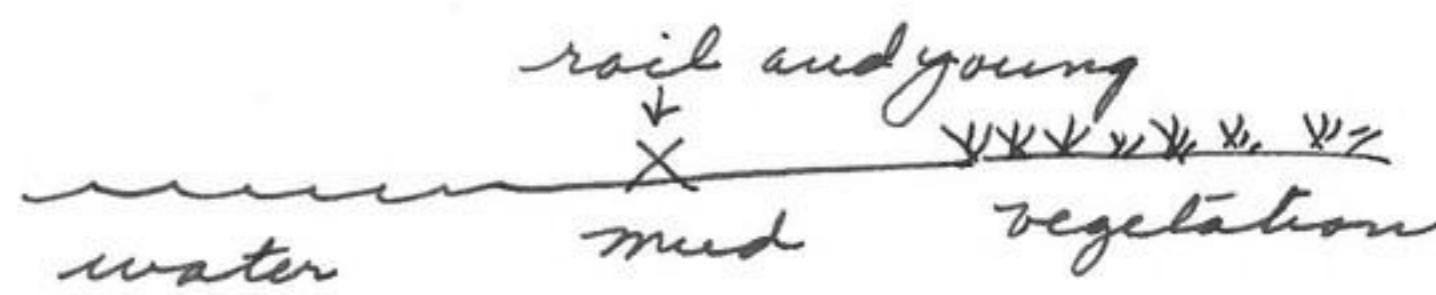

July 1, 1962

A whip-poor-will called for first time this evening at 8:10 P.M. Sky almost cleared from afternoon clouds. Sun behind horizon and lights fading from sky.

3½ mi. S and ⅓ mi. W Lawrence (P.O.), Douglas Co., Kansas

July 2, 1963

Noted one adult and 2 black young (3/4 size of adult) of the king rail, *Rallus elegans*, feeding on recently exposed mud between the present pond and the bordering vegetation.

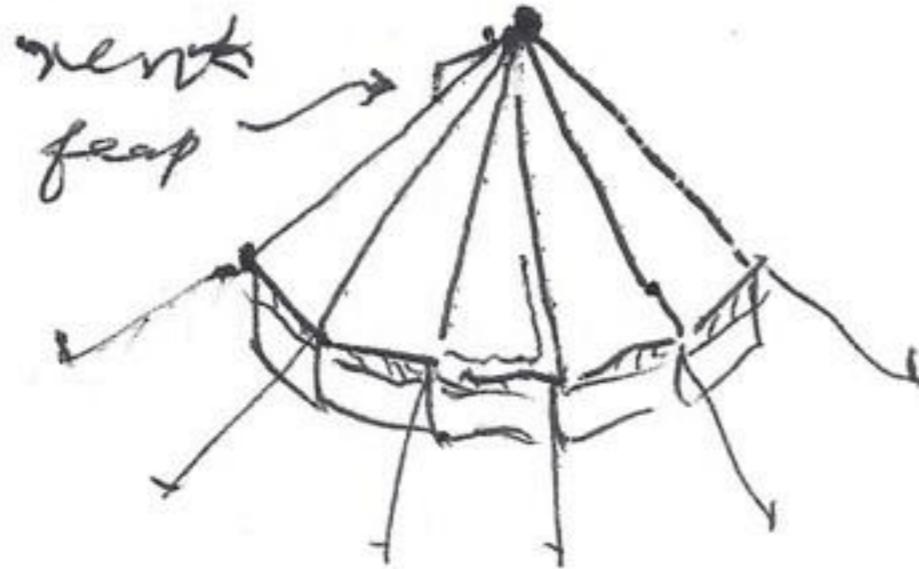

On approach, the two young ran to cover followed by the adult. Observations about 1/2 hours before sundown. Also noted a scissor-tailed flycatcher fly west about 50 feet above the ground.

Lawrence, Douglas Co., Kansas

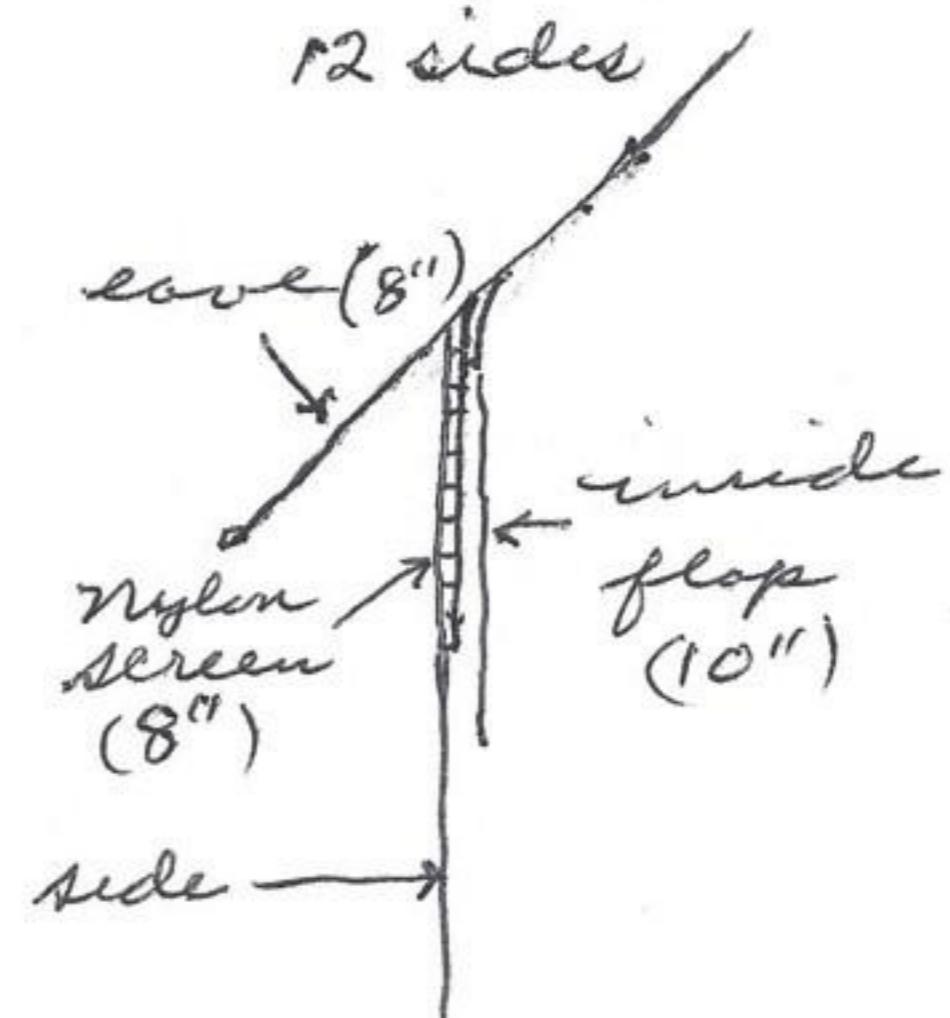

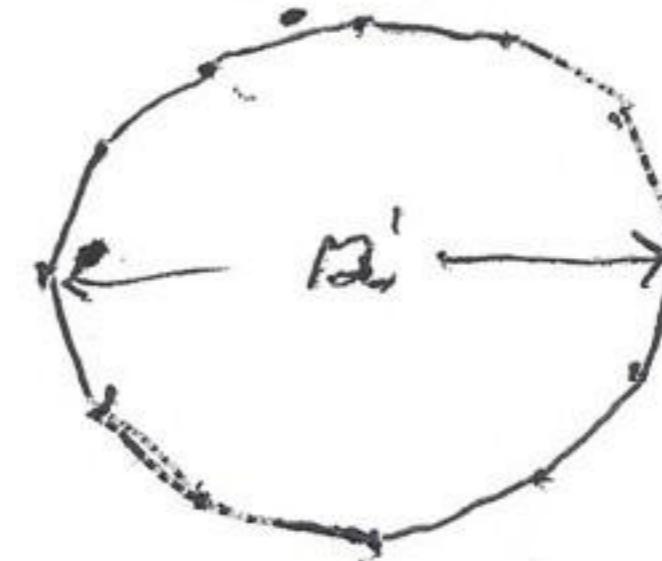

Aug. 2, 1962

Prepared for summer vacation. materials needed
 grommet set and extra grommets
 wrench for springs and general tools
 camera - film - ex meter
 air pump for sleeping bags
 mammal and bird books - permit
 live traps and snares.

journal paper & pens - tags - labels
 made tent out of unbleached muslin (about 135 threads
 per inch which measured:

approx. 10' high
 3 foot side walls
 including 1 foot
 ground cloth.

Recorded the new
 pond and rock
 ledge at home
 with new Nikon F

camera. F.1.4 lens and Kodachrome II.

clothing, 2 pair shoes, socks
panties, jeans, warm shirts, warm
weather clothes (shorts) gloves, caps, jackets,
dress clothes - mum, face soap, field
books, car light, spot light, car licences,
hunting & fishing licences, Blue Cross
Blue Shield, car registration, M ONE 4
Leaving town noted one red-bellied headed woodpecker
at Mississippi and 9th Stut. at 4 mi. N Lawrence
on highway 40 saw one Cathartes franklini. First crow
at Holton! Continuing north on no. 75 to Olathe

arrived Omaha, Nebraska at 5:45 P.M. (north part of City) at 95470. Arrived Fremont Lakes (about 4 mi. w of Fremont) at 7:00 A.M. mileage 95515 or 246 miles (19.6 per today. Photo 620804-1 of tent at night 1 sec & F1,4 (g.v.)

4 miles west Fremont, Nebraska (Fremont Lakes S of grain elevator)

Aug 5, 1962

Daybreak 4:00 A.M. up at 4:30 A.M. Eastern Kingbird calling at 4:15 A.M. On road at 6:00 A.M. Photo 620805-1 of tent, Annette at table. At next stop get sugar, bacon, milk, cups for sleeping bags, matches, fruit, along Elkhorn River between Fremont and Norfolk along river bottom found birds common, especially suezans and blackbirds. More red-headed woodpeckers than to south in Kansas. Cattle ranches with feeding and resting pens on south exposures of river valley. First black tern (about 8) some 4 miles east of Newport, Nebraska. The eastern kingbird has been increasing in numbers since we left Fremont this A.M. noted one field of pure Carex. In all the lakes and marshes we have passed have not seen duck. One grebe (pied-billed) miles w Newport, other black tern also. This area for last 20 miles has been field of grasses & Carex and supersaturated soils. Some sand dunes exposed. Valentine at 93790 - approx 19.5 miles per gallon. North on 83 to S. Dakota. Continued to Badlands Nat'l Monument arrived 7:00 P.M. Mileage 95945. Photos 620805-2 to 620805-5 of Badlands on plateau N E of Park Headquarters.

Badlands Nat'l Monument, S. Dakota (Camp grounds at Headquarters)

Aug 6, 1962

Left 7:00 A.M. Wind last nite caused tent to vibrate beyond comfort so lowered. A combination of high wind & rain would be undesirable. Photo 620806-1 of Jay peak south of headquarters. Photo 620806-2 a few miles west of rugged cuffed. Photo 620806-3 at "Leaves of time" and family to S. Photo 620806-4 abd to west of abrupt slopes & pointed peaks. Photo 620806-5 at "Life in gullies of general area to east. ^{620806-6a idem} 620806-6 abd. All about 7:30 A.M. Photo 620806-7 of first yellow soils of base Oligocene. Isolated grass mesas should be examined for relat populations of plants and insects. Left monument at 8:30 A.M.

continued to Rapid City, then to Rushmore Mt. Memorial Photo 620806-8 of four presidents carvings with Ponderosa Pine limb framing. Photo 620806-9 with telephone 280 mi of Washington. First exposure 30 sec 16F. 2nd 30 sec + 18 sec. Photo 620806-10 of family & monument in background. Continued N to Deadwood, then S 57 N. at Four Mile Cr., Butte Co., on highway 85 noted striped-skunk road kill. At Four Mile Creek (to about 4 miles south) noted more dark buntings (mostly young) than any part of route covered N of Deadwood. Average about 20 per $\frac{1}{10}$ mile in group of 3 to 20. In an equivalent distance N of Four Mile Creek the numbers changed abruptly to about 50 per mile. 3 other striped skunks as road kill in Four Mile Cr. The vegetation is plain grasslands and extensive broad exposures. The dark bunting congregation was very noticeable. Only two marsh hawks and no other kind were noted between Belle Fourche to Redding on highway 85. The dark bunting and mourning dove the two principal and common birds. The eastern or army flycatcher is lacking in this area. Time of census about 6:00 P.M. Large flocks of sheep are grazing the prairie lands. Striped skunk road kill 2 mi N Redig. Census of dark bunt about 3 mi N Redig. first mile, 0; second mile, 0; 3rd mile (one jockeyleaf) 0. At N Moreno River 99.2 mileage (6:30 P.M.); 15 dark bunting in one flock; 2nd mile, 0 dark bunting & 1 marsh hawk; 3rd mile 16; 4th mile 4; 5th mile 34 in one flock; 6th mile 0; 7th mile 0; 8th mile one mourning dove; 9th mile 6 dark bunting and 1 meadow lark; 10th mile, 0. Arrived Picnic Springs about 4 or 5 mi NW N of Ludlow, Harding Co. S. Dakota at 7:00 P.M. mileage 96247.

Picnic Springs, Harding Co., S. Dakota

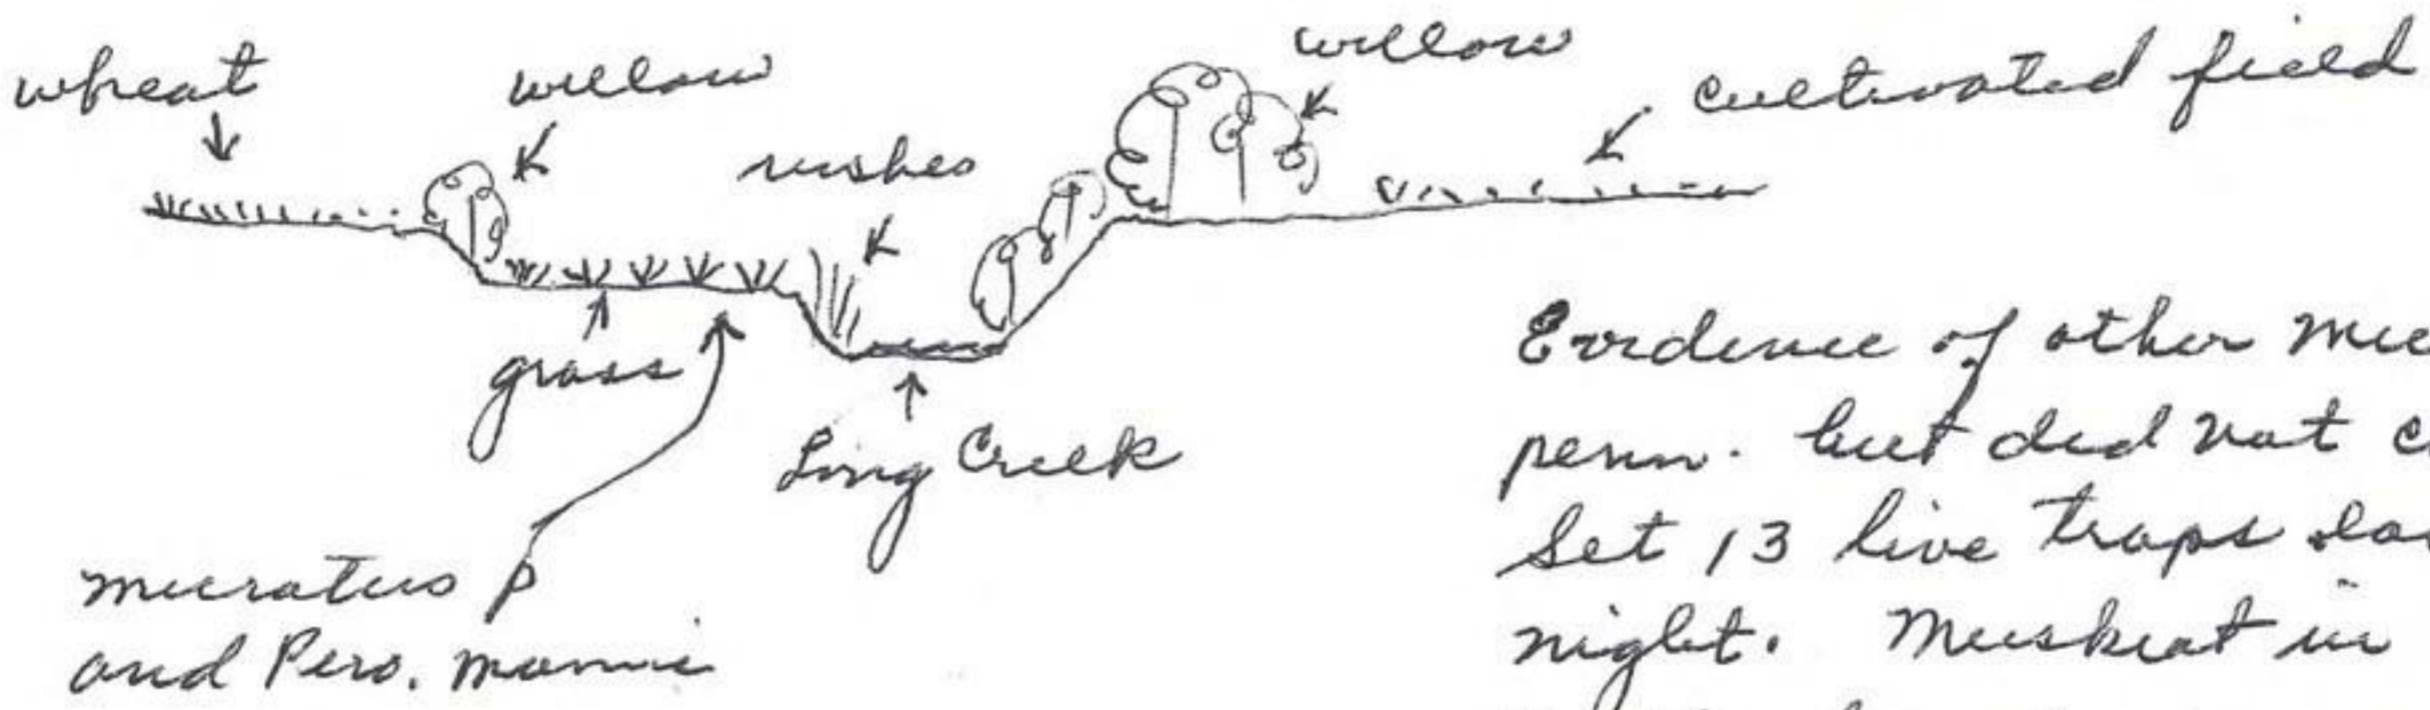

Aug. 7, 1962

Up 4:30 A.M. Left 6:00 A.M. 302 miles yesterday. Photo 620807-1 at Picnic Springs of interior of tent with Annette in sleeping bag, early morning light (5:00 A.M.). Photo 620807-2 of tent with pine border. Photo 620807-3 of tent and family just up, mosquitos many & hungry. Spring at camp good for trapping. Leaving camp noted unusual congregation of meadowlarks, & mourning dove (150 meadow larks & 30 mourning doves) in upper valleys of slope above lowland plains. Blue hills at base found fewer mourning doves but many

5 7/10 mi. S Tribune, Saskatchewan Co., Canada

Aug. 8, 1962

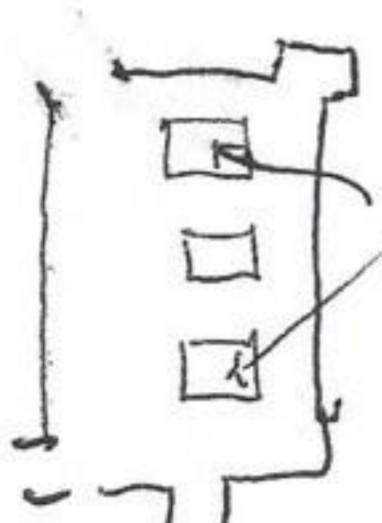

Left Long Creek Camp at 9:00 A.M. Mileage 96553.
From grasses along creek collected the following: (serological
620808-1 *Microtus pennsylvanicus* - 10 grams of potassium
oxalate and 1 drop of merthiolate, 1 drop distilled H₂O. (See Aug. 10)
620808-2 *Peromyscus maniculatus*. ibid (See Aug. 10)
620808-3 *Tyrannus tyrannus* - 80 crystals potassium oxalate
and 3 drops merthiolate, one drop normal saline. Pool of 6 birds.

Evidence of other *Microtus* penn. but did not catch set 13 live traps last night. Muskrat in creek. Mallard and young noted one large *Thamnophis*. Photo 620808-4 of camp at the above camp. Chris & Polly at tent. Continued N to Regina, visited City. Put 620808-5 and 620808-6 of yellow and varied colored flowers respectively at General Hospital to East. At museum of Natural History Photos 620808-7 of beaver exhibit. 620808-8 of Coyote I young; 620808-9 of sandhill cranes and 620808-10 of barren-ground caribou exhibit.

Arrangement:

The exhibits were backed by solid wall to illuminate reflection of opposing wall exhibit. The ceiling was flat and joined circular perpendicular wall which is a bad arrangement. Inside frame too conspicuous. Foreground did not blend into wall background and did not express mood. One floor diagnostic and educational - Not good for naturalistic interpretation. Cold room about 10' x 12'. Scientific housing 3 mammal cases, metal archaeology & Pale birds

preparation room tables
and cabinets surrounding

Space for scientific collections already crowded but many specimens arriving daily.

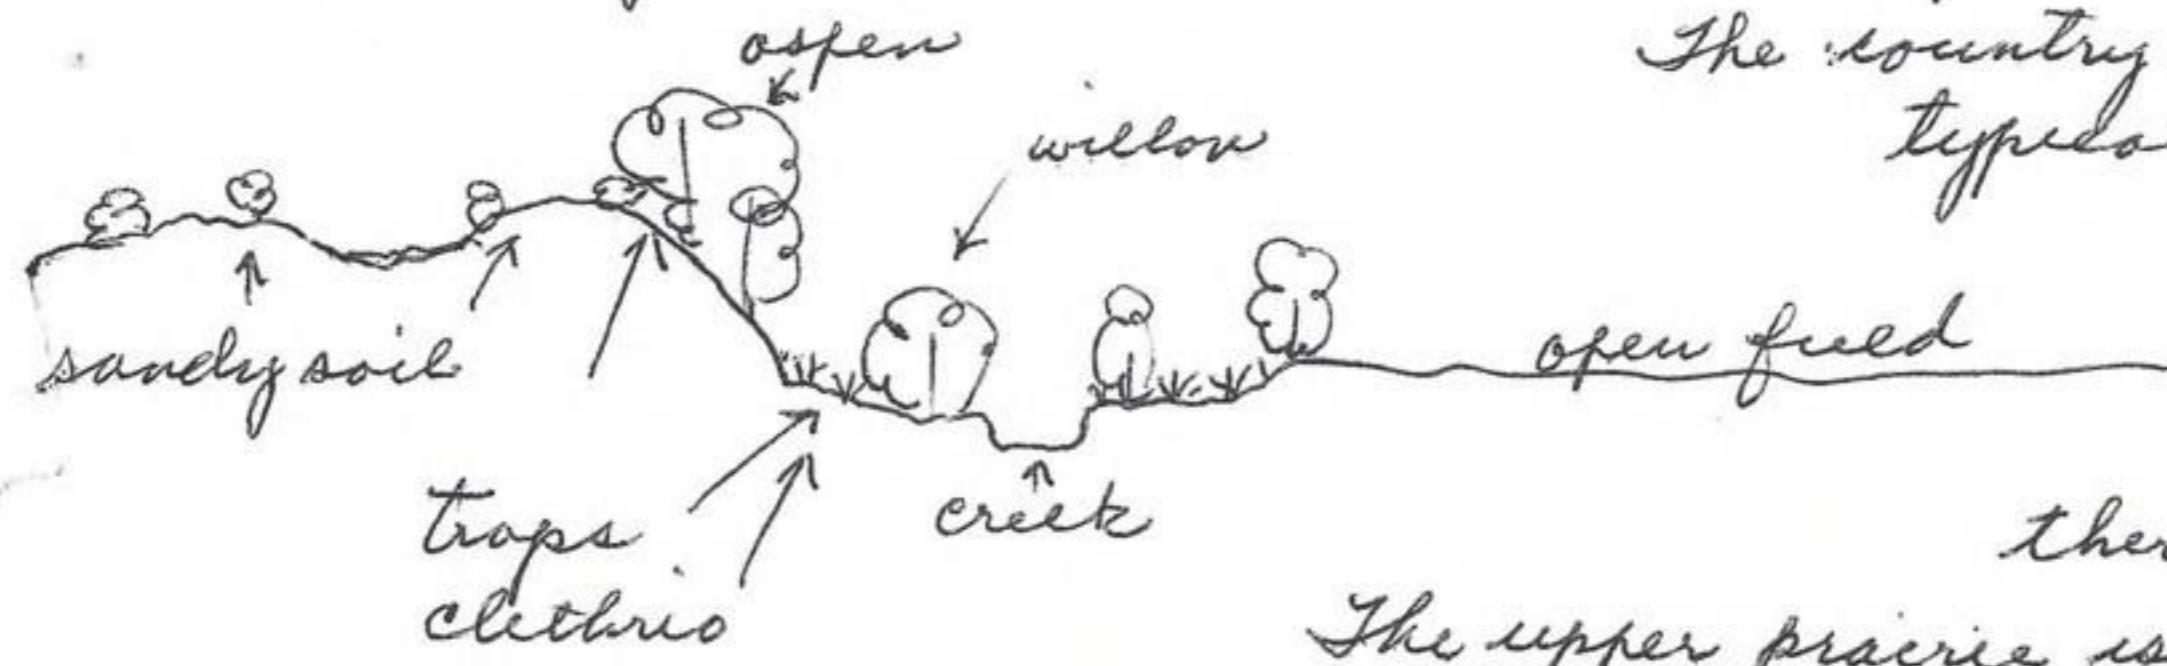

Photos 620808-11 of family in front of museum. Photos 620808-12 and 620808-13 of flowers at museum. Photo 620808-14 of Chris and Polly.

and Polly and sculping at museum. Mr. Bard was not at museum this afternoon. Photo 620808-16 of Mounted Police Training Barracks W of Regina, James R by entrance sign. He was much impressed with the representation of trainees. Museum with a case of artifacts from John Franklin expedition. Continued west and will camp in evening for more trapping. Will travel highway no 1 to Leduc. Sent first film of 36 to Chicago and to be sent to Provo (K 256932). Continued west on highway 1 to Trans-Canada Camp grounds (Besant), 6 miles W of Mortlach. Set 13 live traps along creek.

Besant Camp Grounds, west Moose Jaw, Saskatchewan, Canada

Aug 9, 1962

Mileage at Camp 96448. From 13 traps set along creek caught one *Clethrionomys gapperi*. Rained hard last night. The specimen of *Clethrionomys*, 620809-1 was prepared as zoological tissue. 10 crystals, 1 drop pot. of solute, 1 drop normal saline.

The country is more typically montane with aspen in valleys and vegetation there also montane.

The upper prairie is cultivated in wheat and alfalfa and

slightly rolling. The prairie seems to be as is to south except in draws and short shrubs in protected areas. Only rarely are aspen in open situations. From here to east the topography is as flat as a table top. Photo 620809-2 of Camp at Besant. Chois and Annette in photo. Rained last night but tent did not leak. At area of Secretan the country rolling, small lakes and vegetation including more dwarf shrubs in gullies and on slopes. Isolated willow trees associated with small lakes. Many ducks and other water birds on lakes. The soil is sandy-gravel but not exposed. In traversing Canada from Regina to Calgary (no. 1 highway) the following topography and vegetation is encountered west of Regina flat as a table top and without lakes.

In western Saskatchewan, rolling hills (not associated with drainage systems) and many small lakes, most of them lined with alpine and red alkali tolerating plants.

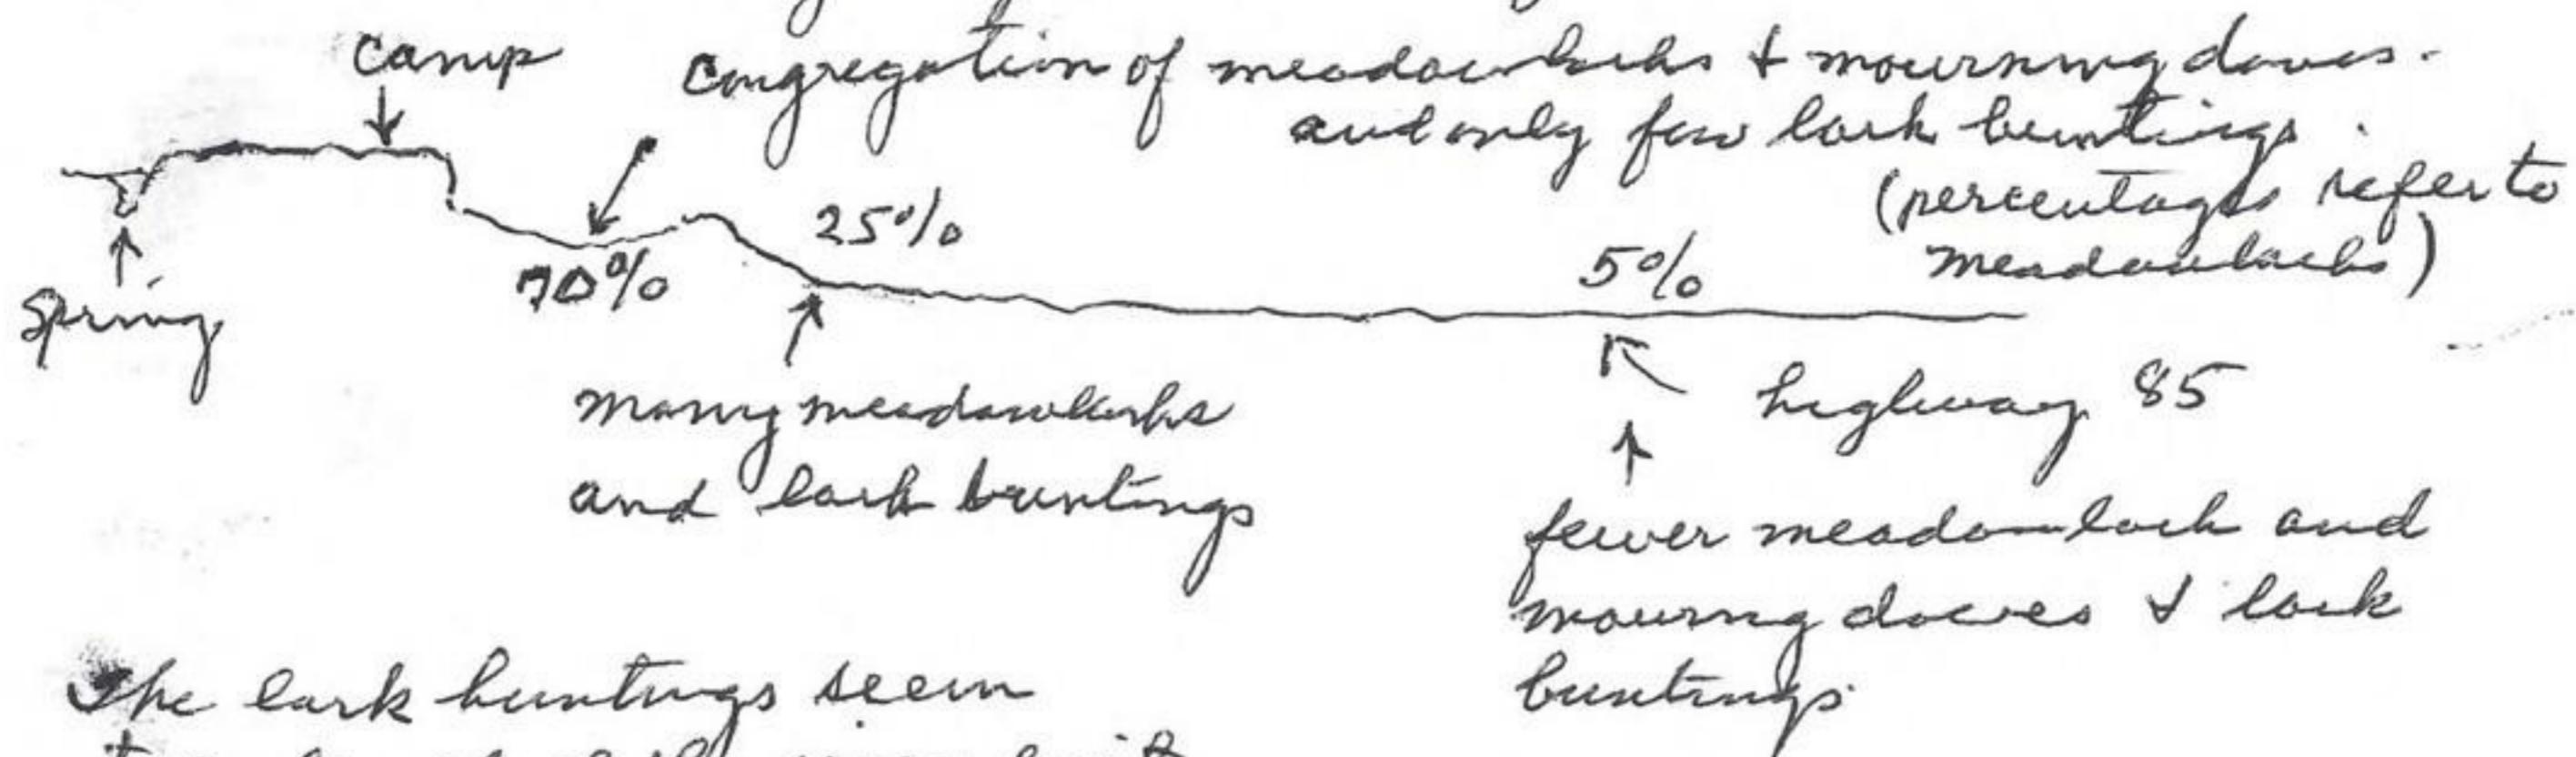

Some lakes completely covered with white everlasting salts (potassium sulfate). Vegetation still good prairie. Toward border the country loses many lakes and is severely overgrazed and associated with drainage systems. In Alberta (Eastern edge) the country changes to a more xeric type, dry lake beds, most frequently without vegetation, short grass and cacti. Bare spaces between plants. This area up to Brooks is reminiscent of West Kansas & eastern Colorado. This area is not like the more montane vegetation used by *Micrathena echinata minor* and may be the limiting factor in excluding them from this part of Canada. Vegetation beyond Brooks less xeric. Greatest congregation of antelope (we have seen 25 in groups of 7-5-4-3-6) in the Brooks area. At 3 miles west of Brooks took photo 620809-3 of white fox-tail-like grass and shallow lake beyond 60x16 F. Across Saskatchewan S of Highway 1 is a cresta that dominates the landscape. Plots 620809-4 of cattle lake a few miles east of Cluny on Hwy I, Alberta, Can. Arrived Forest Lawn Camp site about 8 miles E of Calgary. Set 13 traps.

Forest Lawn Camp (6 mi. E Calgary, Alberta, Canada)
Aug 10, 1962

Added 2 *Peromyscus maniculatus* to serological sample 620808-2.

Added 1 *Micrathena pennsylvanica* to 620808-1. Left 9:30 A.M. mileage 97154 for Calgary. Continued N to Edmonton, first good stands of aspen in gullies between Calgary & Red Deer, beyond open in open stands. At Edmonton country mainly open with solid stands of aspen. Univ of Alberta new and larger than U.V. City cosmopolitan and beautifully situated. In general an excellent place to live. People well dressed and polite. Camped at Edmonton Beach approx. 24 mi. W Edmonton. Set 13 live traps. Met Fish & Wildlife men at this camp. They report that census at Yellowknife (ducks) is lower than last year and due to lack of water has dropped consistently for last 6 years. Over-shooting is not responsible. They used a carryall truck and umbrella tent and 2 canoes with motor attachment (square end). From traps collected 1 *Peromyscus maniculatus* and added to serological specimen 620808-2. The Hudson Bay Co. store is outstanding and modern. Camping (square block + 3 high)

more than on highway 85 in valley.

The lark buntings seem to prefer slightly irregularity of surface or elevated than the flat lowlands river bottoms. Magpies and prairie jays in upper areas. In 2 miles of road (25% area) counted 62 meadowlarks in large flocks, 4 sparrow hawks, 12 mourning doves and 30 lark sparrows. Another group of 4 sparrow hawks beyond. Census of birds on highway 85 below above area (for 2 miles) was 2 meadowlarks, 14 lark sparrows & no mourning doves. Censuses are conflicting and must be taken into consideration when judging actual populations. Cottontail, prairie rabbit & deer in area. A small Citellus (armatus type) at Recan Camp, Valley mainly prairie but some dry farming of wheat & corn. Mosquitos everywhere in this country. Lakes & ponds with ducks which are breeding birds. Only rarely meadowlarks singing. The lark bunting, especially males flying in front of car (side roads) for 200 or 300 feet and dart irregularly back and forth. Lakes with good stands of bull rushes and vegetation. First aspen trees in gullies 4 or 5 miles N of Grassy Butte, McKenzie Co., N. Dakota highway 85. Lark bunting common to Grassy Butte and a little beyond. At Little Missouri River & beyond I did not see the bunting until Alexander where I noted one. The country changes only slightly beyond Little Missouri River. The river itself could be a barrier to prairie mammals. I expect the Missouri River is the actual northern barrier. will check vegetation north of this river.

Arrived Williston at 12:10 at 96455. Continued to Fortuna, thence N to Long Creek approx 2 1/2 miles S of Tribune, Saskatchewan, Canada. (Memorial Park) Arrived 5:30 P.M., mileage. Set 13 live traps near camp along Long Creek.

Edmonton Beach Campsite, 24 miles w Edmonton, Alberta, Canada.

Aug. 11, 1962 (Saturday)

Left Camp 8:00^{a.m.} at 97394. Heavy dew last night. Best to place tent where sunshine dries tent in early morning. Country west of Edmonton gradually changes from open country to parkland to solid forests of aspen, birch, then aspen, birch, larch and black spruce; some areas of balsam fir. Good stands of black spruce in low extinct lake beds. no noticeable change of fall colors. Porcupine most common road kill. Lakes in timbered country supported only a few ducks probably on the backs of 1 duck to 50 on the prairie. Photo 620808-3 prominent peak to left at Pocohontas 620808-4 & 620808-5 Jasper deer. Photo 620808-6 - Whirlpool R. Bridge - Mts River to west - Amelie in foreground - Leach Lake 620808-7 Jay in foreground - ⑧ ⑨ ⑩ Athabasca Falls. - Vistas about a few miles west Athabasca Falls 620808-11 Photo ⑪ 7 mi. east of Stutland Glacier ⑫ Photo ⑬ shooting upstream at base of icefield Photo ⑭ Columbian & ce. Aug 12, 1962

Left Camp 9:00 A.M. at 97741. Photo 620812-1 of Lake & Camp. 620812-2 of tent. 620812-3 of glaucus & flowers above Lake Louise. Photos 620812-4 of family at Lake Louise Chateau; 620812-5 of Lake and 620812-6 of family x lake. Will continue highway 1 to west. [leaking water pump caused us to go to Banff for repair. At Banff photo 620812-7 of private home and 620812-8 of city to mt. [last photo 620812-7 of private home and 620812-8 of city to mt. Returned to Lake Louise, then went highway 1 about 3 mi. w photo 620812-9 of mts + lake in foreground. Photo 620812-10 of same area in telephoto (W.G.) In Glaciers Nat'l Park 620812-11, 620812-12 and 620812-13 and 620812-14 of cloud pictures. This road is thru wilderness and is new but did not see small mammals or birds or road-kills. Larger trees than in Jasper Park areas. Two bears

56

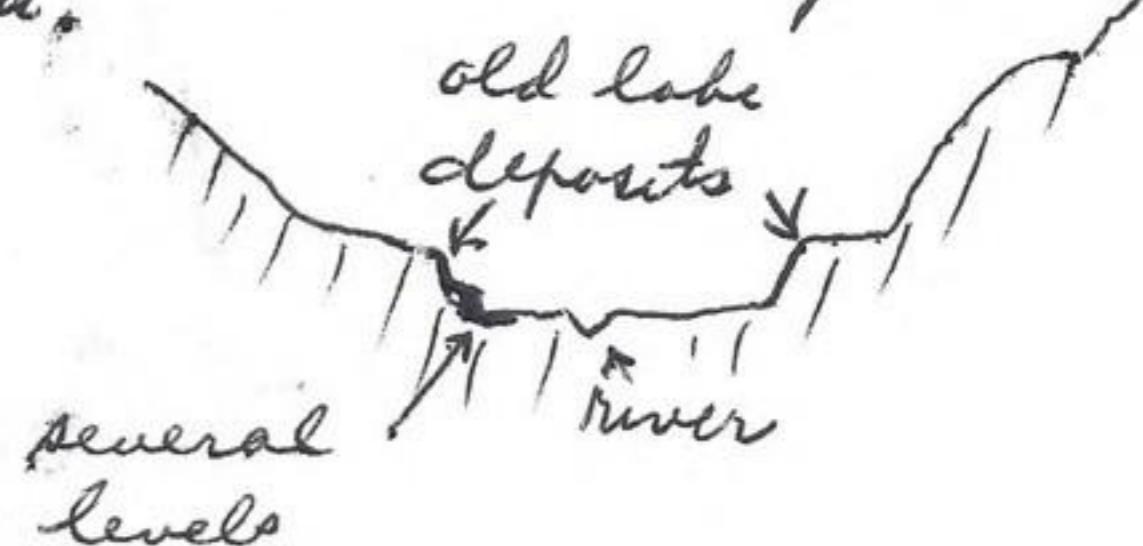

(Photo 620812-15 as we arrived from east) 620812-56
arrived Revelstake, (Rotary Park 5 city) at 9:00 P.M. 97997.
Entire route in clouded condition (but visible for mts).

Revelstake, Alberta, Canada

Aug 13, 1962 (Monday)

Left 7:00 a.m. highway 1 at camp took following photos.
620813-1 Camp; 620813-2^{1a}, 620813-3, 620813-4, 620813-5,
620813-6, 620813-7 of Jay sunning ^{also 620813-7a-7b-7c} & driving in lobes. Photo
620813⁸, 620813⁹, 620813¹⁰ of Christy Valley along lake. Roofs
of houses in city with metal surfaces. Country west of creek
of range belongs to NW vegetation complex. A tourist in-
formant (Revenue Service living at Calgary) reported the
following: a. Calgau best climate in ^{western} Canada. at northern
limit of Chinook winds, more wind than at Edmonton.
Edmonton considerably cold both in summer & winter. Area
east of Calgary drier and more windy. Last few years dry. nearer
Rocky mountains. In Malakwa area some buck thorn
changing to yellow and some ground shrubs. First apple
trees noted 4 miles w of Malakwa. Canada has overextended
itself financially and new political program (austerity program)
will reduce expenditures. Color change fast in aspens.
No evidence on hillsides. Home in Malakwa Valley and
beyond are old and weather beaten. The wild grass is piled
in high columns ~~BB~~ 10 feet x 4 feet approximately. Raven
not uncommon here. Photo 620813-11 of Lake Shuswap
from W. end to east near Salmon Arm. Eastern Kingbird
at Chase. First mourning dove ^{since} Jasper area
at Chase. Country along Big Thompson mainly
Ponderosa pine and open slopes of cheat-grass and sage brush
(junction 97 and 1). This valley is bordered by old lake
deposit several hundred feet high.
most of the lake land
deposits are unvegetated, others
in great sagebrush. This
country is becoming more
and more like Columbia Gorge
on east end of Cascade mts.

Dove lived with a narrow,
sometimes isolated cottonwood trees. Hap country. This
valley certainly has an outstanding lake deposit on sides of
valley. The volcanic rocks of slopes may control vegetation

Photo 620824-4 of Mothers High School Diploma 1902.

Traverse Range, Utah - Salt Lake Co., Utah

Aug 25, 1962

Son James and I made afternoon trip to top of range separating Utah & Salt Lake counties, east of the Jordan narrows. Part of the photos may have been in Salt Lake County but I am referring to all of them as having been taken in Utah Co. Dad left us on main highway just north of the gravel pit at the Point of the mountain. Our objective was to take photos of the area and to investigate a shoreline above the Bonneville Level. Itinerary from Point of mt to ridge leading east, to top, thence S E to high point, thence S to valley, thence W to main highway where we were picked up again by Dad on his return from Salt L. City.

photo 620825-1 Western extent of Bonneville Level at narrows. The gravel slope is at gravitational repose from gravel pit at base of slope. The exposed gravels has allowed wind to blow sands up slope onto flat part of the delta. It will be noted that the prevailing wind is from the south and not from the north as apparently it was in Pleistocene time (from n). The sands have created an ecological niche that supports the kind of vegetation usually associated with the more desert areas of western Utah County. Dipodomys are in sandy area and small holes that could be Perognathus. wherever the wind has blown clear the soils at edge of delta, one can find artifacts of old Indian camps. The north end of Utah valley can be seen in the distance. The upper slope of grass (Chet) is the upper Bonneville level. It would be of value to trap this area for mammals, especially for possible Perognathus.

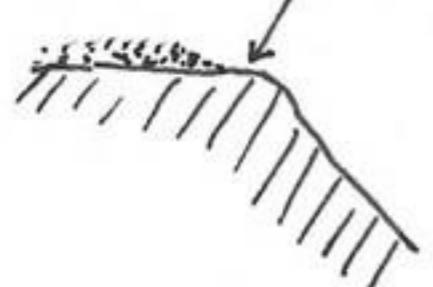

Photo 620825-2 From top of Bonneville level near western extent. Jordan Narrows in foreground. Also Jordan River can be seen. The successional shoreline are well defined from the river west to conspicuous Bonneville Level. This area would be a profitable one to work and correlate with shorelines on east side of Antelope Island in Great Salt Lake. The ^{feet} level above the Bonneville Level is perhaps an old erosional level of Pleistocene or pre-Pleistocene times. The rocks on the slopes of the foreground are calcareous tufa.

Photo 620825-3 from near above but to east with mt. Timpanogos and Cascade Mt in background. The Bonneville level is at base of two knolls at right side of photo. These knolls are old sites of Indian Camps (S side). An irrigation ditch, a railroad grade and an old highway are in foreground. Successional levels can be seen below knolls. The lower level is Provo level.

Photo 620825-4 from same area as above showing calcareous tuf cementing gravel and stones. The calcium bicarbonates is precipitated when air is mixed with water in zone of wave action. This zone is just below Bonneville level. Jones R in foreground.

620825-5 On Bonneville level at base of mt showing flat level of Bonneville level and eroded slope of mountain from action of Bonneville Lake. Granite Range in distance. The currents were SW along this slope and debris produce delta beyond.

620825-6 From ridge, shown in photo above, showing steep slope created by Bonneville Lake. Granite Range in background

Bonneville level at base of Granite Range. Sagebrush on lower slopes of the foreground. The same type of faceted spur can be seen on ridges of Granite Range as occur of the Transverse Range.

620825-7 James R on ridge trail leading to top of ridge. Same ridge as photo above. An interesting erosional gully parallels this ridge. Artemesia of limited growth.

620825-8 James R on main ridge of Transverse Range beyond high point. Chet grass covers slope. Utah Lake, Lake Mt and Mt. Nebo in distance. Grazing and winds probably produce the chet-grass covering.

620825-9 N side of ridge (Transverse Range) with steep slope leading down to Bonneville level. Sheep trails mark the slope. S end Salt Lake Valley in background. There is good evidence of old erosional levels than Bonneville in distance. Ogurrah Range in distance (far distance).

620825-10 James R on ridge just beyond top. Chet-grass slopes. Cedar valley in distance. Despite the dryness of these slopes, they are beautifully covered with grass.

620825-11 Some general area on ridge as above. Utah Lake and Lake Mt. in background. A golden eagle was noted flying in canyon directly below. It was seen later on high peak to S of here. Artemesia covering lower slopes.

620825-12 east end of main ridge (long faceted spur) with Granite Range in distance. Bonneville level below. On flat area above Bonneville level may be higher level. In the area to right of this photo on flat divide not a blue-grey gratacatcher feeding a bird three times the size of the gratacatcher. I could not determine kind but about size of a bluebird. The foster bird fluttered wings as the gratacatcher brought in food. Watch the feeding take place 5 times. The foster bird moved about and followed in the general direction of the movement of the gratacatcher. Area of Quercus & Artemesia.

620825-13 Salt Lake Valley from ridge. Large uncultivated delta the Provo level of old Lake Bonneville.

620825-14 From ridge to east showing Bonneville levels. One elevated level in back of faceted spur in foreground. The canyon in foreground, when viewed from head of drainage looks like a glaciated canyon. Could it have been glaciated when Transverse Range was much higher before faulting ^{down} from Wasatch Range? Even the slopes of the range look like the wind swept erosions of above timberline topography.

620825-15 From ridge to west. Lake mt and Utah Lake in distance.

The vegetation to left was the type inhabited by the grackle.

620825-16 Granite Range (telephoto). Bare slope caused by wind.

620825-17 From peak in center of Traverse Range with Utah Lake, West mountain and Mt. Nebo in distance. Rock Island in Utah L.

620825-18 James R from South peak showing ridge in middle ground (the ridge of the faceted spur and the one we traversed from left to right and the one from which we took several of the above photographs) and Great Salt Lake in the distance. Antelope Island can be seen.

620825-19 From S peak of Traverse Range at rock outcrops showing long gentle slope to Utah valley below. Utah Lake and West Mountain in background. Also West mt & mt. Nebo can be seen. Lehi in valley below.

620825-20 Ibid.

620825-21 From south peak showing knoll to east with unusual distribution of oak, sagebrush and cheat-grass exposure. Timpanogos and Cascade Range in background. The Knoll in the middle distance would be an excellent vantage point to photograph the Alpine area (Granite Range and Timpanogos).

620825-22 From S peak to west showing Jordan Narrows and beyond to Ogden Rouge. Puff of smoke from Utah Copper Mine (generally blasting is at 4:00 P.M.). The large delta of the Bonneville Level is clearly pictured here.

620825-23 Near base of Traverse Range on S side. Utah Lake and valley at sundown. Lehi in foreground. The elevated level above the Bonneville level is above the general area where this picture was taken. This level slopes from west to east where it joins the Bonneville level. A photo taken years ago from near Lehi shows this shore-line.

Provo, Utah Co., Utah

Aug 26, 1962

Photo 620826-1, 620826-2 and 620826-3 of Grace Spear Bee and Robert G. Bee in front of their home in Provo.

Oct. 19, 1962

Robert Pierson presented me with 2 Buteo jamaicensis which he shot while hunting other game. One of these hawk was prepared as a museum specimen.

621019-1 Buteo jamaicensis, 663^{mm}, total length, 925 gms weight. ♂
The left testis measured 6 x 2 mm; the right one 4.2 x 1.5 mm.
The second bird 621019-2 measured 680 mm t.l., 1175 gms wt.
and was a female with ovary measuring 11 x 3.5 mm, ^{♂ side} ^{♀ top view.} view.
The wing spread was 1305 mm.

Topeka, Shawnee Co., Kansas

Oct. 20, 1962

noted continuous line of bronze grackles flying across the city of Topeka at about 3/4 hr. before sundown. These birds were flying SSW into sun at about the Y.M.C.A. building. The flight line was approx 80 birds abreast and the flock almost continuous in length. It required 20 minutes for this long line of birds to pass by. Photos 621020-1 to 5 of Mary Pauline and her four faces of Rushmore and her normal.

Wakarusa River, Douglas Co., Kansas

Oct. 21, 1962

Annette and I made canoe trip on Wakarusa River from Blue Mounds Bridge to Slichtmans Crossing. Left 3:00 P.M. arrived 4:30 P.M. Numerous tracks of raccoon along edge of river at water edge and below on shelf which is probably made and maintained by raccoon. Foothie beaver. noted 5 Rana pipiens on bank at edge of water. Other birds were 1 mallard, 1 great blue heron, 2 red-tail hawks, 3 great horned owl, numerous squirrel 1/3 at edge of water at

Sightman's Crossing which is approx. 6/10 mi. W of the mouth of Spring Creek (Tangoanopic sandstone of the Stronger Formation of Pennsylvanian Age) turned canoe over to son James and his friend Robert Pierson. They continued to Bridge N of Eudora arriving 7:00 P.M. They noted 2 beaver, small flock of ducks, probably blue winged teal, 1 great blue heron and other small birds and squirrels.

Wakarusa River (From Blue mounds Bridge to Sightman's Crossing). Douglas Co., Kansas.
Oct. 28, 1962

Usual birds and mammals observed on route. No spotted sandpipers on this date.

wakarusa River - Kaw River, Douglas and Leavenworth Co., Kansas.

Nov. 3, 1962

James Robert Bee and I made trip (canoe) on Wakarusa River from Blue mounds Bridge to Kaw River. Left 12:00 A.M. Between Blue mounds Bridge to Sightman's Crossing (nest bridge down river from Blue mounds bridge) noted approx. 25 squirrels, 40 red-bellied woodpeckers, 6 Rana pipiens (jumped into water from bank), 8 great horned owls, 5 red-tailed hawks, muskrats and the usual small birds. Arrived Sightman's Crossing at 2:00 P.M. From this bridge to bridge N of Eudora did not keep complete river. Arrived bridge N of Eudora at 4:17 P.M. At a point on Wakarusa River 5 1/10 mi W and 3 1/10 mi N Eudora (P.O.), Douglas Co., Kansas, son James had shot two wood ducks:

621103-1 ♂ wood duck, 440 mm t.L., 660 gms weight, testes 

621103-2 ♀ wood duck, 430 mm t.L., 620 gms weight, ovary 

The two ducks were resting on a limb of a submerged log in river.

Continued down Wakarusa arriving at mouth at 4:45 P.M. One active beaver at mouth on left side of river. Vegetation along river after leaving bridge N of Eudora predominately willow in contrast to vegetation along Wakarusa upstream. Harris sparrows in area; no spotted sandpipers.

Lawrence, Douglas Co., Kansas

Nov. 4, 1962

Son James Robert shot 1 mallard, ♀, east of town. It measured 485 mm t.L., 940 gms wt.

4 mi. S Lawrence, Douglas Co., Kansas(P.O.)
Nov. 5, 1962

Noted 1 Wilson Snipe. Last night 28° F. This A.M. at 8:00 A.m. leaving falling like rain; the first of this kind of activity this autumn.

Wakarusa River - Kaw River (from Blue Mounds Bridge, Douglas County to De Soto), Kansas.

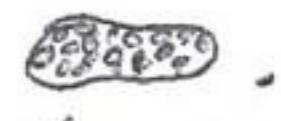

Nov. 10, 1962

Son James Robert and I made canoe trip down Wakarusa to mouth, thence down Kaw River to De Soto. Left at 8:45 A.m. from Blue Mounds Bridge. Made few observations of special interest. At 9:15 twenty mourning doves in one group in vegetation bordering the river. Arrived Sington's Crossing at 8:50 A.m. Having used paddle moderately but all the way. Enroute noted 16 great horned owls, 21 red squirrels, 2 red-tailed hawks, 1 killdeer, blue jays unusually common and calling about every block or so, large flock of starlings, no frogs, beaver or muskrats, no crows. There were the usual small birds. Arrived Cleffs (about 3000 feet down creek from Little Wakarusa Creek) at 10:35. One great blue heron here.

10:40 flocks 20 robins and several yellow-shafted flickers together.

10:55 Cliff (next beyond above and beginning of last long stretch to bridge (Highway 10). 11:05 Highway 10 bridge, no owls since Sington's Crossing. 11:30 bridge N Eudora.

11:55 Mouth of Wakarusa River. A great horned owl was noted at exactly the same spot as noted on a previous trip. It flew down creek and alighted in same tree. At mouth of creek noted 1 spotted sandpiper and 1 kingfisher. Continued down Kaw River. Beyond the first bend to east at a point 9/10 mi. E and 1 1/10 mi. N Eudora (P.O.), Douglas Co, James Robert shot a lesser scaup duck. It measured:

621110-1 ♀ lesser scaup, 385 mm t.L., 700 gms wt. ovary .

Ten shovellers also left the river at this same point. At 1:30 at N end of bend (under utility lines). At 2:10 at S end of next bend at train arch bridge. Arrived De Soto at 5:00 P.M. Crows arriving to sandbars at about 4:45 P.M.

Wakarusa River, Douglas Co., Kansas

Nov. 11, 1962

Took 5 color shots of Annette C and Mary Pauline at cliffs at a point 1 mi S and 1 1/2 mi. W of Eudora (P.O.) or 1000 feet E and 2000 ft N mouth Little Wakarusa Creek. They are as follows:

- 621111-1 Mary Pauline & Annette Christine in canoe below rapids.
- 621111-2 " " " " " " " " at cliffs
- 621111-3 ibid, large tree in foreground.
- 621111-4 ibid " " " "
- 621111-5 ibid, from top of cliffs
- 621111-6-7-8 of Mary & Chris in same general area en canoe.

Wakarusa River, 1 mi S and 1 1/2 mi. W Eudora, Douglas County, Kansas

Nov. 13, 1962

Took several color photos of cliff and river (same area as nov. 11):
 621113-1 to 621113-25. I have noticed that the trend of clouds in sky is clear in A.M. and at about noon clouds appear from S and continued to about 80% sky coverage before 3:00 P.M. Afternoons are not favorable for photography: Wasps at rocks (cliffs) and about 1 per sq. foot - too many to approach cliff area. Photos taken between 12:30 P.M. 2:00 P.M.

Dightmans Crossing, Wakarusa River, Douglas Co., Kansas

Nov. 13, 1962

Took six color photos of Tonganoxie Limestone along Wakarusa River just above bridge (about 4:00 P.M.)

- 621113-16 under cut limestone just upstream from bridge
- 621113-17 " " " and mosses on protected slope
- 621113-18 " " " " " " "
- 621113-19 " " " " " " "
- 621113-20 Down creek from bridge
- 621113-21-22-23 upper limits ^{of cliff} and ripples in foreground

At bridge made telephoto shot to east of creek & trees. This area about 7/10 mi. W mouth Spring Creek, Little Wakarusa Creek.

Wakarusa River, Douglas Co., Kansas

Nov. 18, 1962

Son James Rabert and I made canoe trip down Wakarusa River from Blue Mounds Bridge to Bridge N of Eudora. Left 10:25 A.M., arrived Dightmans Crossing 11:30 A.M. One great blue heron & a muskrat here. Cliffs near Little Wakarusa Creek 12:30

21
69
Near cliffs noted approx. 40 mourning doves in one group.
Arrived Eudora bridge (N of Eudora) 2:00 P.M.

Lawrence, Douglas Co., Kansas

Nov. 17, 1962

Mr. Davis killed a wood duck near Peoria, Kansas.
It measured: ♂ 625 gms wt and 453 mm t.l. This bird
was more bulletant than the wood duck we recently shot
on the Wakarusa - 621103 + Collected Nov. 3.

Wakarusa River, Douglas Co., Kansas

Nov. 23, 1962

At a point on Wakarusa River approx 8000 feet down river
from mouth of Little Wakarusa River, took several color photos
of cliffs and river.

621123-1 cliffs and down river - sycamore on left of picture

621123-2 ibid and canoe in foreground.

621123-3 (no G.)

621123-4 (n.G.)

At a point about 1000 feet up creek from highway bridge 10
photographed

621123-5 of trees reflected in river

621123-6 ibid (n.G.)

621123-7 up river with two large stumps in water in foreground

621123-8 low cliffs and canoes.

Photo taken between 1:00 P.M. & 3:30 P.M.

6 mi. S and 4/10 mi. W Lawrence (P.O.), Douglas Co., Kansas

Nov. 25, 1962

At a pond S of Lawrence took 4 color photographs of the
area to test Adens film:

621125-1 Cattails, close up

621125-2 east end of pond to north

621125-3 to S from N end.

621125-4 (n.G.)

NE of Pleasant Grove, Douglas Co., Kansas

Nov. 25, 1962

Photo 621125-5 of fence line, well handle + pastures somewhere
a few miles NE Pleasant Grove.

Photo 621125-6 of forest edge + creek in same general area

Rock Creek SW Clinton, Douglas Co

Nov. 25, 1962

Photo 621125-9 of creek and forest trees.

Photo 621125-10 of orange orange fruit on ground.

Coal Creek, Douglas Co., Kansas

Dec. 2, 1962

Collected along Coal Creek from mouth of creek to point directly west of Blue mounds. From the specific locality 4 1/10 mi. S and 4 1/10 mi. W from the mouth of Coal Creek collected the following:

621202-1 Cedar Waxwing 202 T.L., 36gms ♀ ovary 7 mm in length
 621202-2 Tree sparrow 155 T.L., 13gms ♀ ovary 2 mm "
 621202-3 " " 156 T.L., 14gms ♂ testes approx 1 mm.

621202-4 Goldfinch 125 T.L., 11gms ♂ testes 1 mm
 621202-5 L. shrike 189 T.L., 98 wing.

Other observations are: frog calling, otters noted; a snake approx 1 foot long swimming up current in Wakarusa River at mouth of Coal Creek; 1 butterfly; crickets calling; a pair of Peromyscus maniculatus and young in nest under board in open cleared field, young about 80 mm T.L., the adults were different in color; usual winter birds; many robins; few bluebirds; 6 rabbits (cottontails).

Lawrence, Douglas Co., Kansas

Dec 2, 1962

Determined proper size card for file cabinets. Measurements should be taken from bottom of card which in turn should be of good quality and of proper thickness.

	60 mm
BAILEY, V	7 mm
1902	5 mm

	10 mm

* Lawrence, Douglas Co., Kansas

Dec 10, 1962

First snow of season and low temperatures

Patters Lake on K.U. campus frozen completely. yesterday
lake frozen around edges.

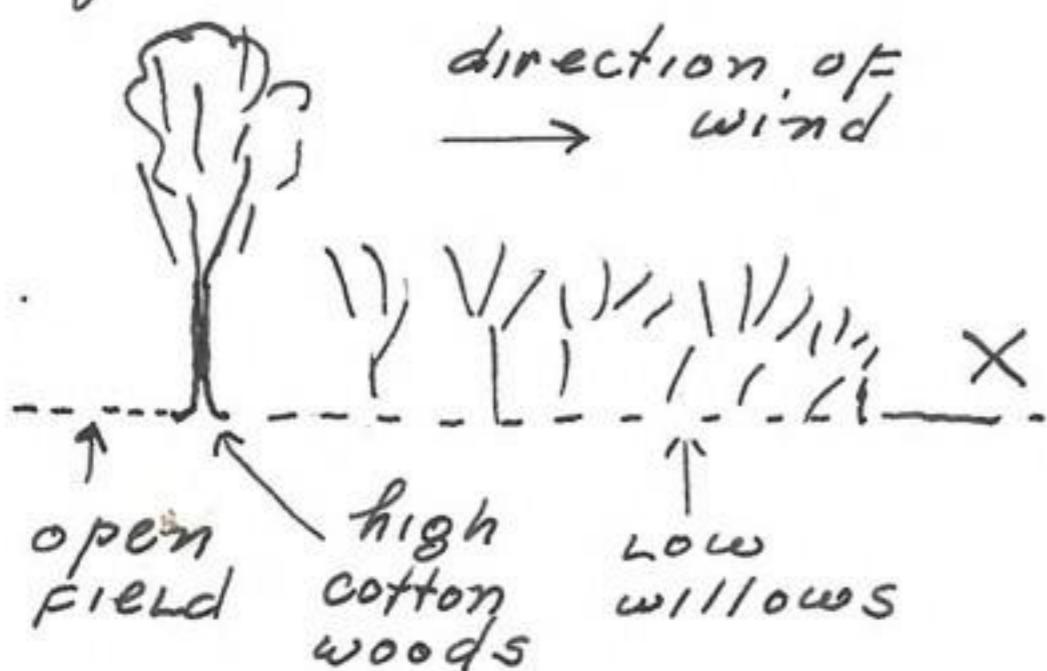

8/10 mi. N and 3 1/2 mi. E Lawrence (P.O.), Kansas

Dec. 9, 1962

Collected the following birds from above locality and made museum specimens:

- 621209-1 Red bellied woodpecker, 241 mm T.L., 77 gms, ♂, testis 2 1/2 mm
 This bird had several pieces of conifer sap on belly feathers.
- 621209-2 Song Sparrow, 170 mm T.L., 19 gms wt., ♂, testis 1 mm.
- 621209-3 Lincoln Sparrow, 143 mm T.L., 13 gms wt., ♀, ovary 2 mm
- 621209-4 Swamp Sparrow, 142 mm T.L., 11 gms wt., sex?
- 621209-5 Tree Sparrow, 150 mm T.L., 10 gms, ♀, ovary 2 mm.

Wind blowing from NW and extremely cold for human comfort. This condition was particular tree on broad open field of the river bottom. On the lee side of trees the wind was reduced in velocity and temperature

appeared warmer. It is necessary to have high tree as first barrier and small trees or willows as secondary barrier. There was apparently no adjustment by birds to this protected area. Small tree alone do not offer as good a barrier as the combination of high tree and low trees.

*

4/10 mi. N and 3 1/2 mi. E Lawrence, Leavenworth Co., Kansas

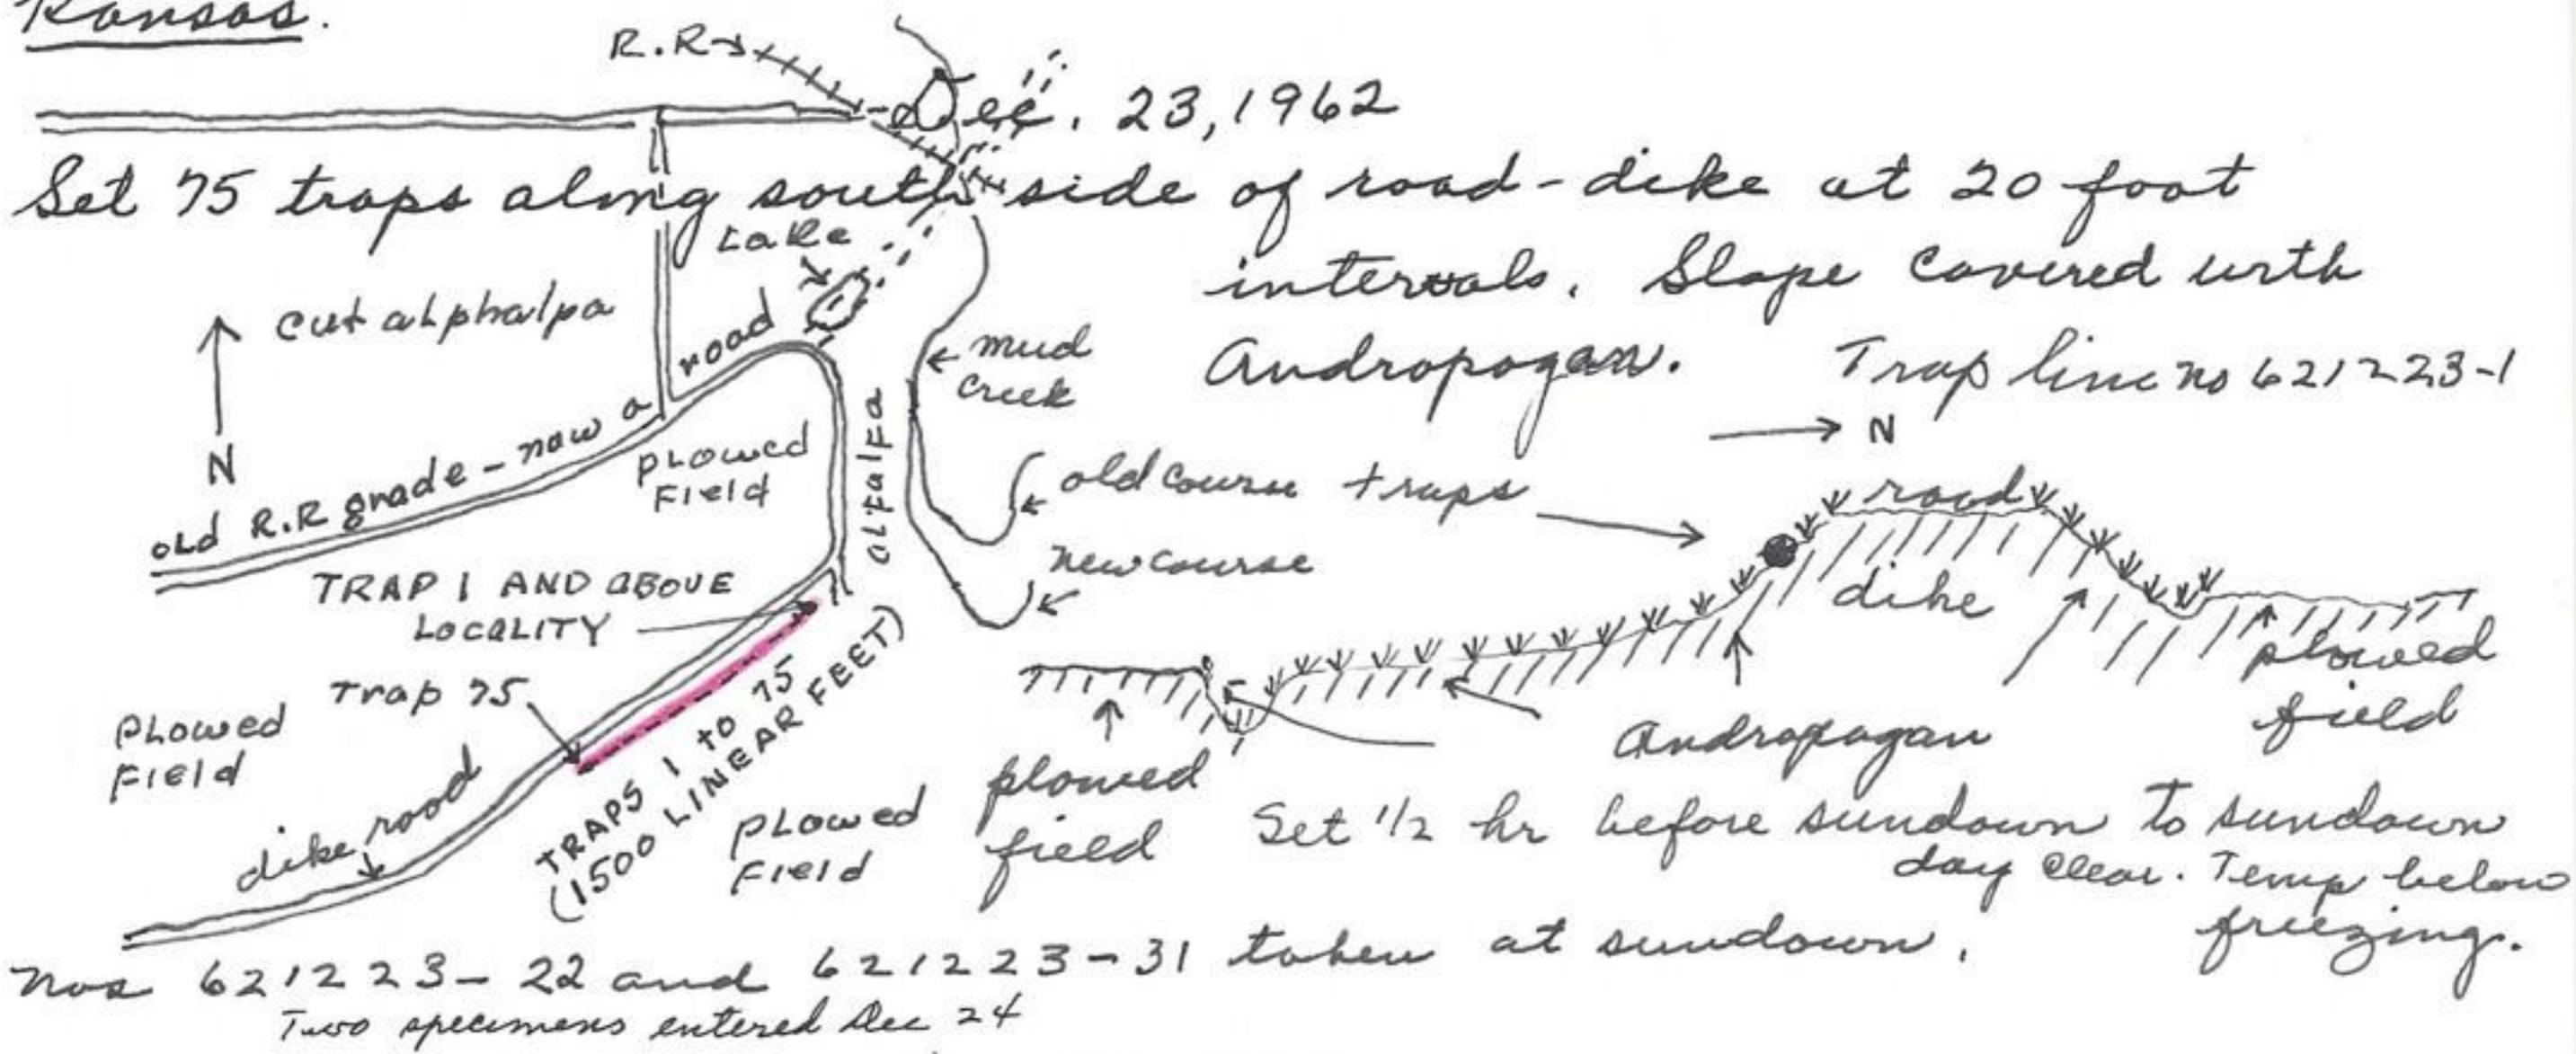

Dec 15, 1962

Collected the following birds and prepared as museum specimens:

- 621215-1 Song sparrow 150 mm T.L., 16 gms wt., ♀ ovary 2 1/2 mm
 621215-2 " " 152 mm T.L., 17 gms wt, ♀ " 3 mm
 621215-3 Cardinal 220 mm T.L., 43 gms wt., ♂ testis 2 mm
 621215-4 G. Cr. Kinglet 102 mm T.L., ♂

Noted a prairie falcon resting in field at about the county line between Douglas and Leavenworth counties on old railroad bed. When it left the area it flew in a more or less direct line to the south as far as the Kaw River. Horned larks in area, some on sand bars along river. Beaver very active at mouth of Mud Creek, having cut about 20 cottonwood trees some 6 to 8 inches in diameter. Trees fell according to leaning angle, those near river toward river.

1/2 mi. N and 3.925 mi. E Lawrence (P.O.), Leavenworth Co., Kansas.

Dec 24, 1962

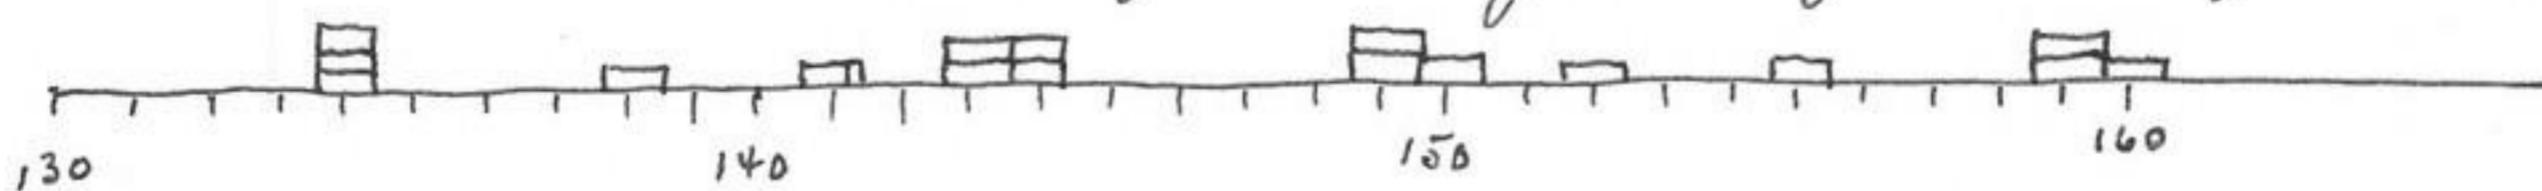

Same locality as above. Examined trap line 621223-1 this A.M. at 8:30. Temp 20°F. cloudy sky. (nos 22 and 31 of last night)

Lawrence, Douglas Co., Kansas

Dec. 24, 1962

Started to snow this afternoon. Temp at 6:00 P.M. -23° F.

Lawrence, Douglas Co., Kansas

Dec 25, 1962

At 10:00 A.M. (light snow, Temp 28° F), noted an eastern fox squirrel, Sciurus niger climb up one tree on the underside of trunk and limbs and cross over to another tree and descend to the ground by hanging on to the underside of the limbs and trunk. New snow covered the upper surface of the limbs - ~~so~~ a definite attempt to evade the snow. Unusual number of robins in Lawrence area.

3/10 mi. S and 3/10 mi. W mouth Coal Creek, Douglas Co., Kansas

Dec 25, 1962

Collected the following birds from the above locality in wooded area along Mud Creek. This area has always supported many birds because of small pond associated. The pond is now frozen but the birds are still in area. They may be there because of protection from wind.

621225-1 Cardinal ♂

621225-2 white-throated sparrow 168 mm T.L., 32 gms ♀

621225-3 black-capped chickadee

621225-4 downy woodpecker

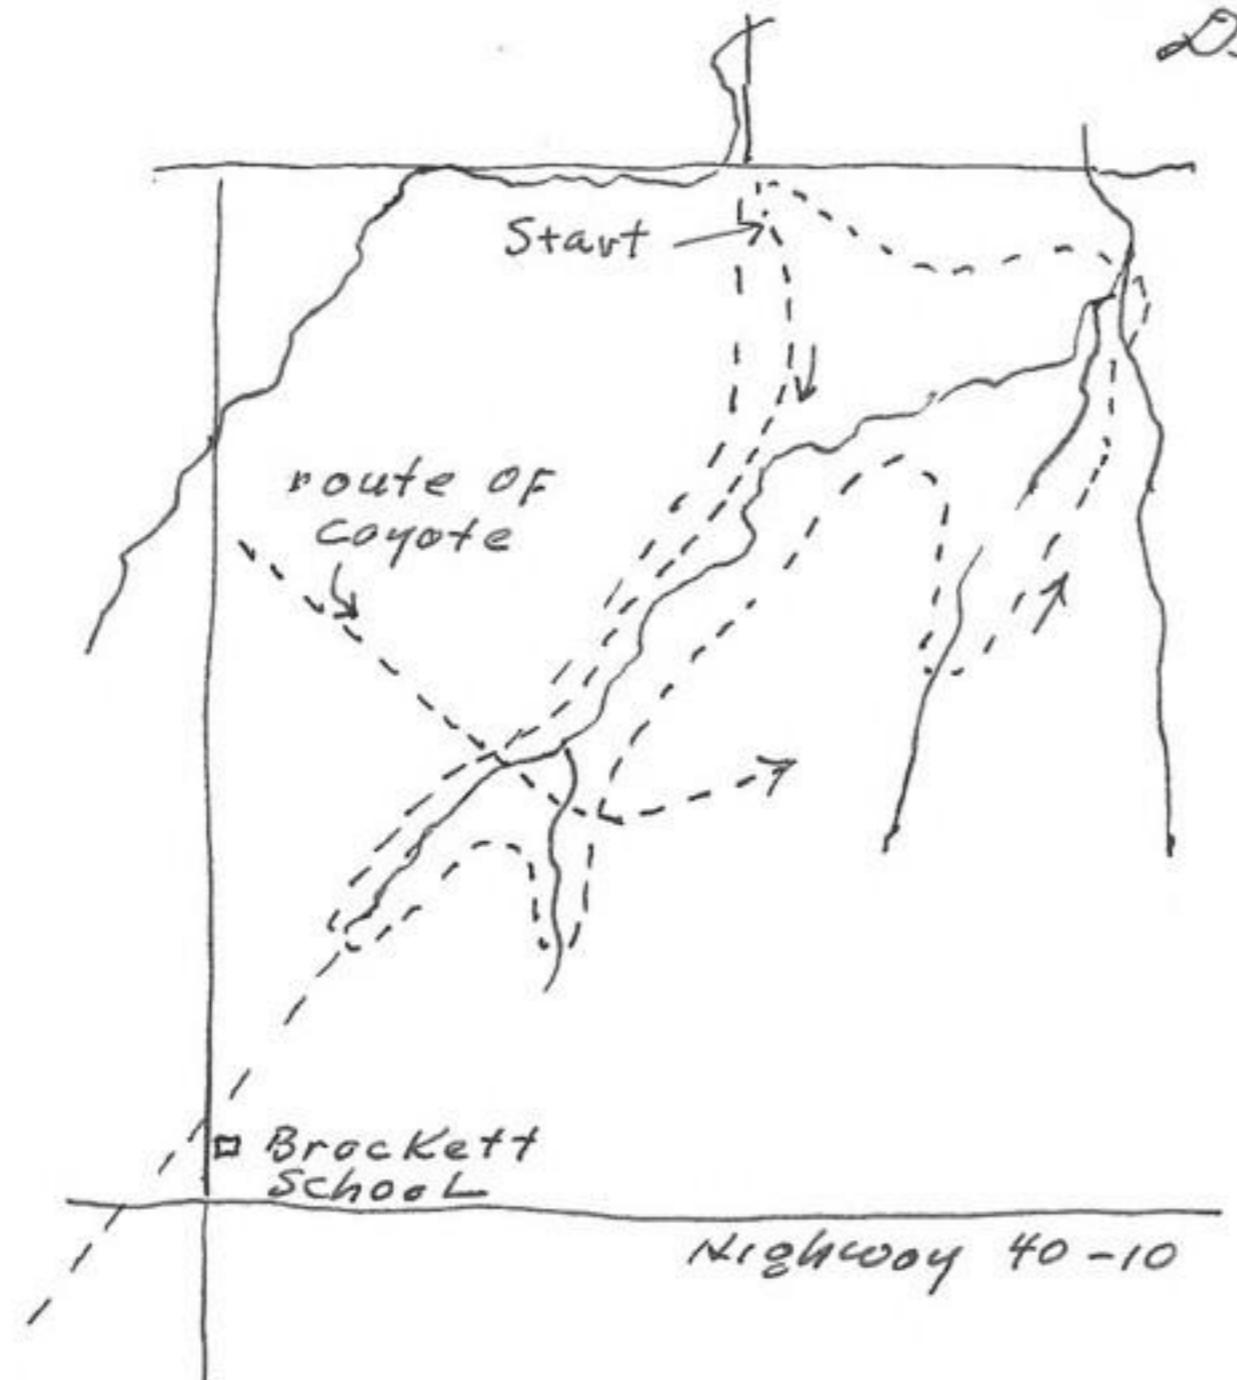

621225-5 titmouse

621225-6 titmouse

⁶²¹²²⁵⁻⁷ ^{Cardinal ♂} The following birds were observed in the area: unusual number of robins (this is true throughout the County), 1 mock-ingbird, golden crowned kinglet, marsh hawk (in open field), song sparrow, 8 bluebirds, 1 loggerhead shrike, crows, 1 great horned owl, 1 red-tailed hawk, meadowlarks, sparrow hawk, titmouse, clay-colored juncos, downy woodpecker, yellow-shafted woodpecker. At about 20 minutes before sundown, several birds arrived to above area from the NNE including 5 male Cardinals, 1 white-throated sparrow. They appeared to be arriving for roosting purposes. The white-crowned sparrow alighted in bushy growth 15' above the ground and remained motionless for about 2 minutes until shot. One coyote passed through area. Approx. 40 quail were in area with tracks concentrated in one area. Three titmice fed on one section of limb with concentrated effort.

2⁶/10 mi. W and 1/2 mi. N Lawrence (P.O.), Douglas Co., Kansas

Dec. 26, 1962

Son James R., his friend Robert Pierson and myself made short trip to check on birds. From above locality collected the following birds from the upper reaches of the canyon. This entire area is native trees with considerable downed timber. The utility line from the Kansas Power Co runs through the area and produces a cleared area through the forest.

621226-1 loggerhead shrike ♂

621226-1a *Pipilo erythrourhynchus* 200 mm t.L., 44 gms wt. ♀ ovary 5 mm long

621226-2 Golden-crowned kinglet 102 mm t.L., 5 1/2 gms wt. ♂ testes 1 3/4 long

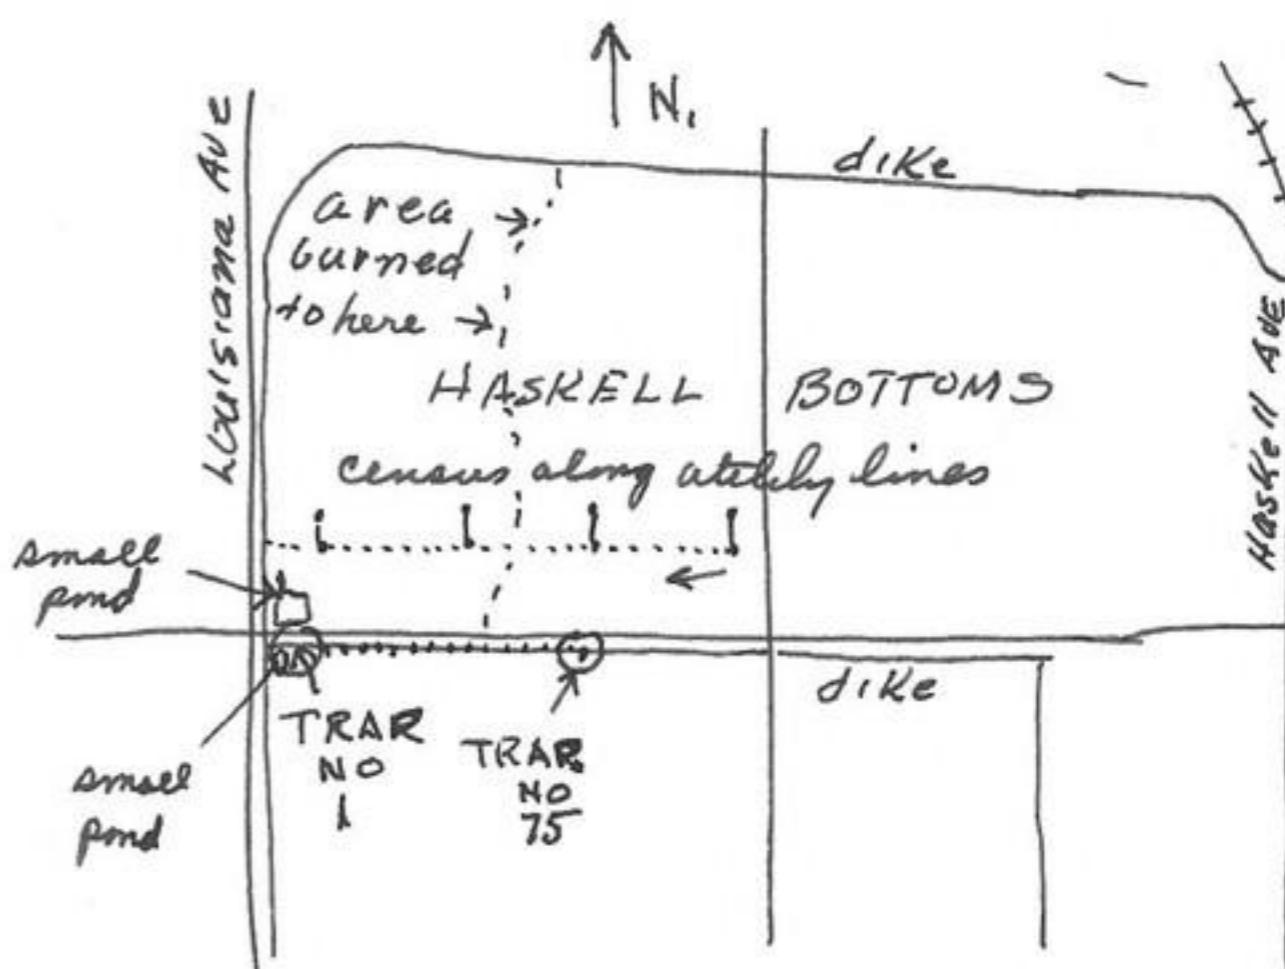

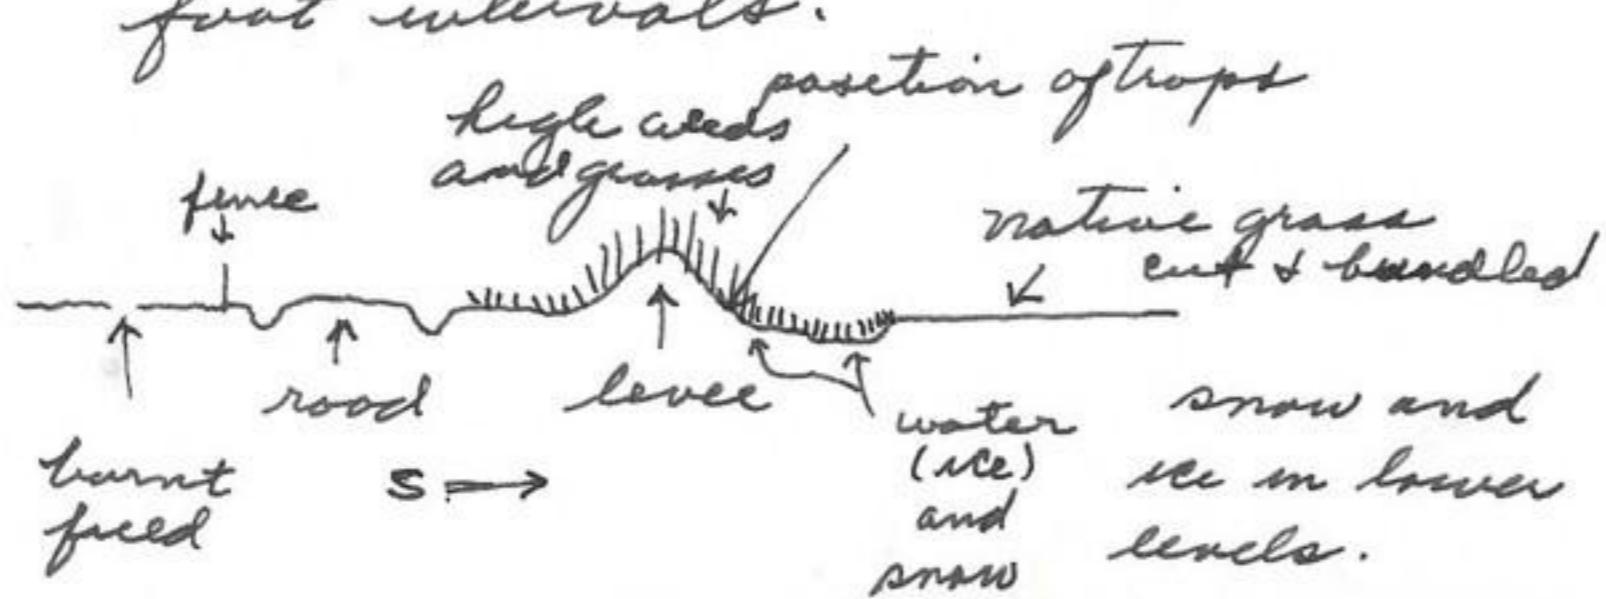

621226-3 downy woodpecker

Cottontail rabbit numerous, there being tracks at least every 20 feet or so, some areas concentrated. Observed 15 but there were probably many more. One coyote crossed canyon in a straight forward course even though we shot at it once and it was within 20 feet of point where the coyote crossed the canyon. This coyote had been chased by dogs in the canyon to the west and had escaped to this canyon. Other tracks of coyotes and fox in this area of rabbit concentration.

3 9/20 mi. S and 7/20 mi. W Lawrence (P.O.), Douglas Co., Kansas

Dec 30, 1962

At a point above to 1500 feet east along the ^{south} side of a level that parallels a county road through the Haskell Bottoms, set 75 traps at 20 foot intervals.

Made census of *Microtus ochrogaster* & *Spermophilus* along utility line (see figure at first of account) from 4th set of poles to levee to west. There were no runways except at level (20 feet E.) where dense grasses had protected trampling of cattle (area now burned). Cattle imprints almost continuous with droppings averaging 6 feet apart. In areas east of levee area the grasses were too completely trampled to permit small mammals to exist in the fields.

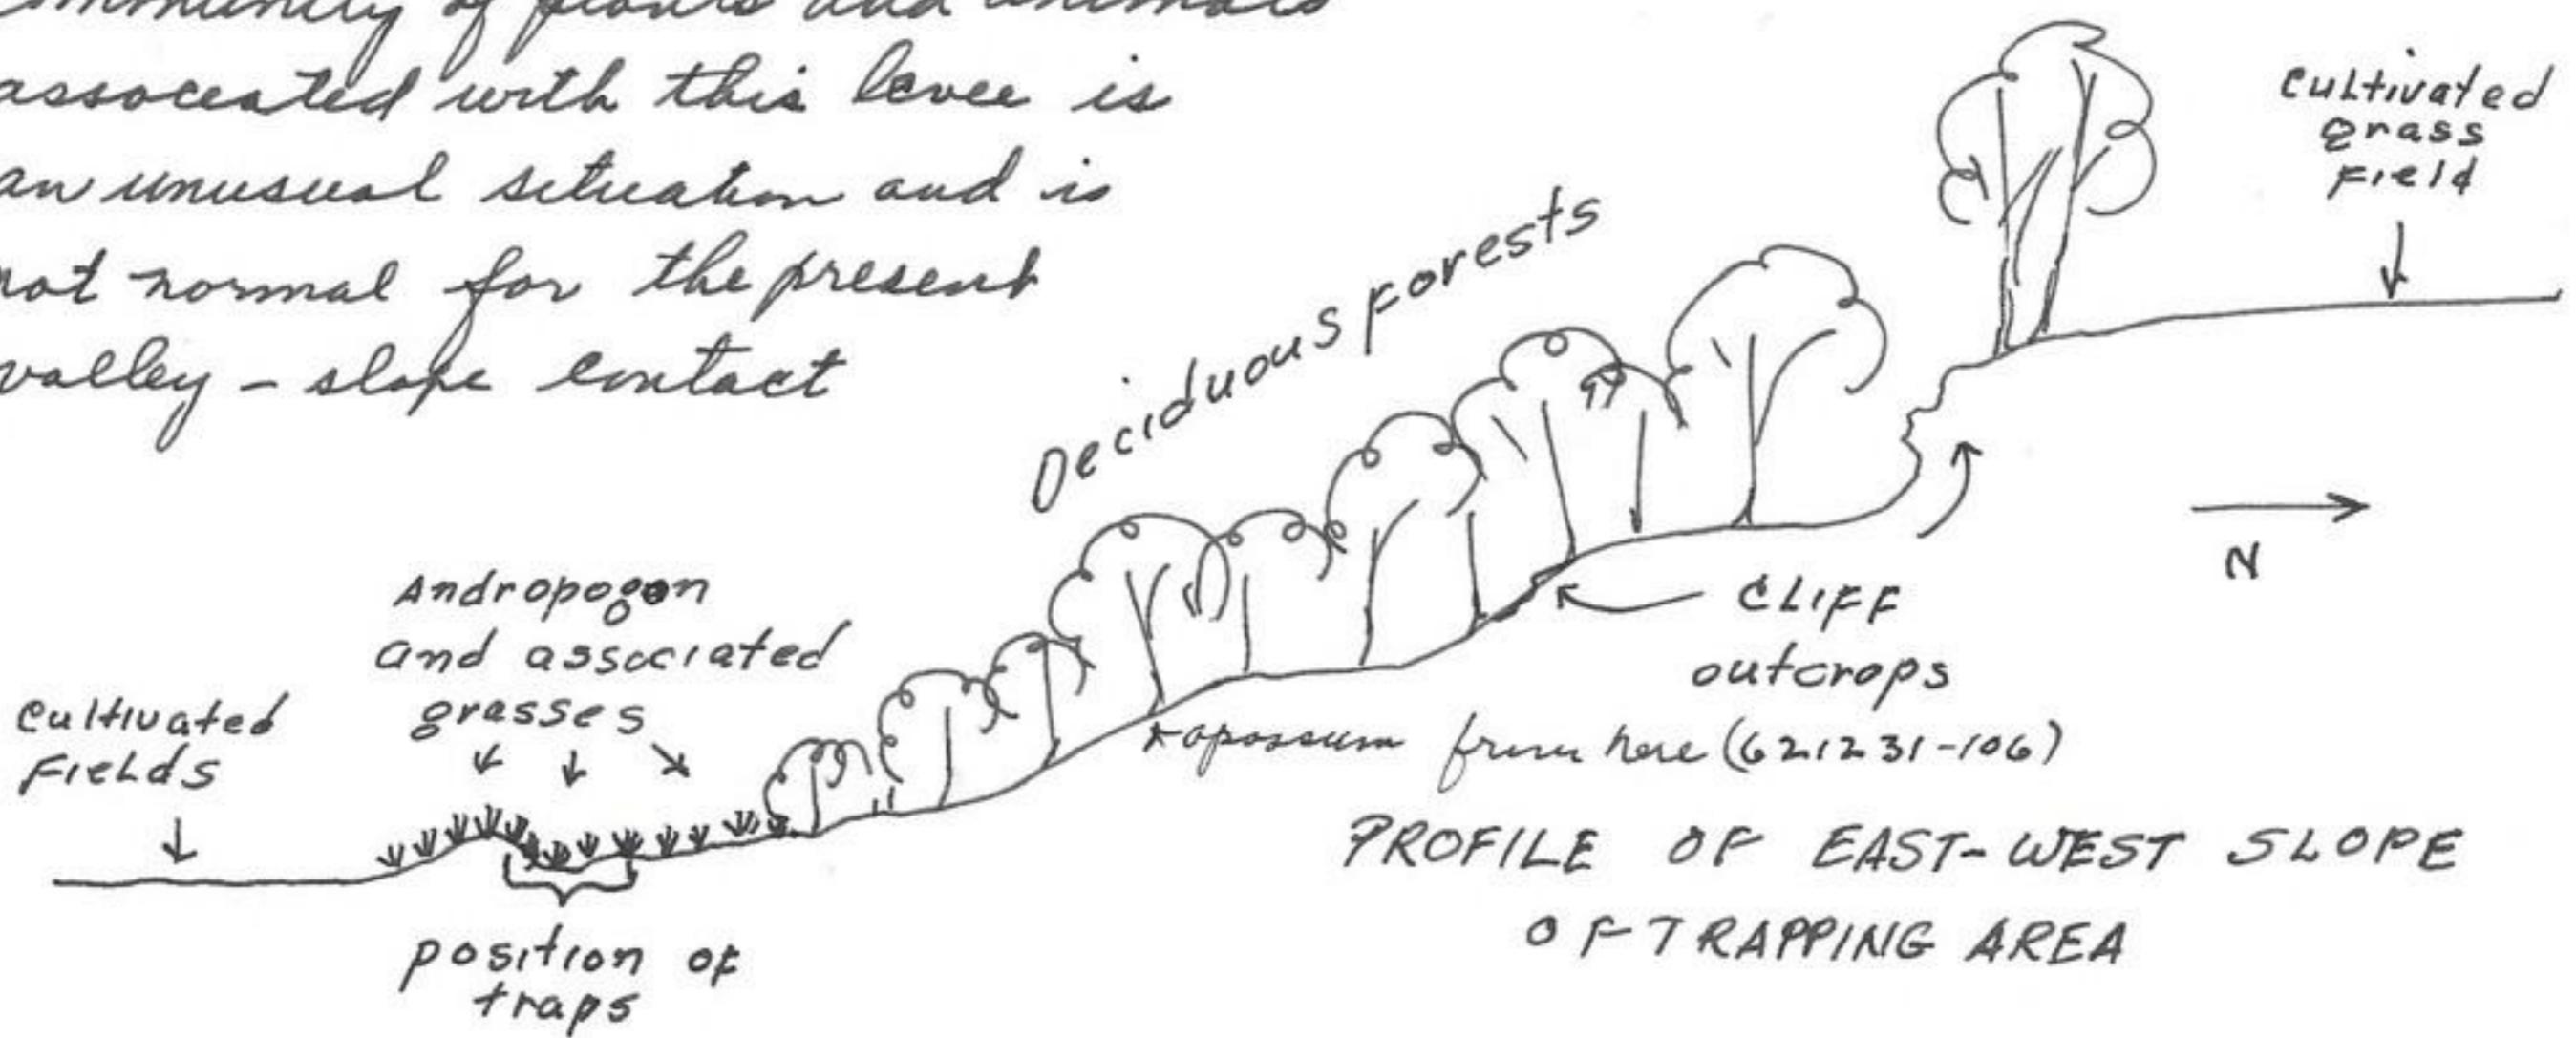

8
15/20 mi. N and 1 mi. E Clinton, Douglas Co., Kansas Co. 621231-78
Dec. 30, 1962 [Trap not exact locality]

This afternoon set 100 traps n & E of Clinton on the north side of the valley. All traps were associated with a dike (about 3 feet high) which had been placed along the base of the slope for the purpose of diverting runoff water to the east. Except at the lower end in area of traps 1 to 10, the soils were dry. The only permanent marsh is across the road to the east. Marsh type vegetation is limited to this small area.

Toward slope the grasses end abruptly and dry slopes continue thru deciduous forests.

Toward the valley the grasses end abruptly at base of levee and cultivated field (corn etc and plowed each year) continue to the Wakarusa River. The community of plants and animals associated with this levee is an unusual situation and is not normal for the present valley-slope contact.

along the Wakarusa. Traps set at sundown (concluded). Temp 40°F, Day clear.

Dec. 31, 1962

621231-106 Opossum (skull only)

Prepared the following mammals from trap-line inspected this A.M. (field numbers also represent trap number):

<u>621231-3</u>	<i>Peromyscus maniculatus</i>	202-80-28-15-52 gms
<u>621231-5</u>	<i>Reithrodontomys megalotis</i>	138-51-18-13-18 gms ♂ testis 9 mm
<u>621231-8</u>	" "	120-56-16-13-8 gms ♀ ut. normal
<u>621231-17</u>	" "	149-71-18-12-12 gms ♂ testis 5 mm
<u>621231-18</u>	<i>Microtus ochrogaster</i>	153-39-20-12-35 gms ♀ ut. normal
<u>621231-25</u>	" "	126-26-20-12-25 gms
<u>621231-29</u>	" "	150-30-19-12-42 gms ♀ 1x2 plac scars
<u>621231-47</u>	<i>Synaptomys cooperi</i>	131-23-20-10-40 gms, 3x0 emb 43 mm
<u>621231-52</u>	<i>Peromyscus maniculatus</i>	146-55-18-15-23 gms ♀ (dest.)
<u>621231-60</u>	<i>Peromyscus maniculatus</i>	222-92-30-17-74 gms
<u>621231-66</u>	<i>Peromyscus maniculatus</i>	124-45-17-13-13 gms ♀ ut. normal
<u>621231-67</u>	<i>Synaptomys cooperi</i>	141-23-21.5-10-47 gms, testes 6 mm, side glands
<u>621231-80</u>	<i>Peromyscus maniculatus</i>	128-47-18-14-10 gms ♀ (dest.)
<u>621231-81</u>	<i>Reithrodontomys megalotis</i>	122-55-17-12-8 gms ♀ ut. normal
<u>621231-82</u>	<i>Peromyscus maniculatus</i>	150-55-19-13-21 gms ♂ testis 8 mm
<u>621231-90</u>	" "	139-51-18-13-17 gms ♂ testis 7 mm
<u>621231-93</u>	<i>Microtus ochrogaster</i>	151-31-21-12-43 gms
<u>621231-102</u>	<i>Peromyscus maniculatus</i>	125-48-19-14-12 gms ♂ testis 6 mm (SK. only) (dest.)
<u>621231-104</u>	<i>Microtus ochrogaster</i>	129-30-19-12-28 gms
<u>621231-106</u>	<i>Didelphis virginiana</i>	602-170-60-50-2 3/4 lbs ♀

(621231-47)

The *Synaptomys*, had three embryos in the right uterus. They measured:

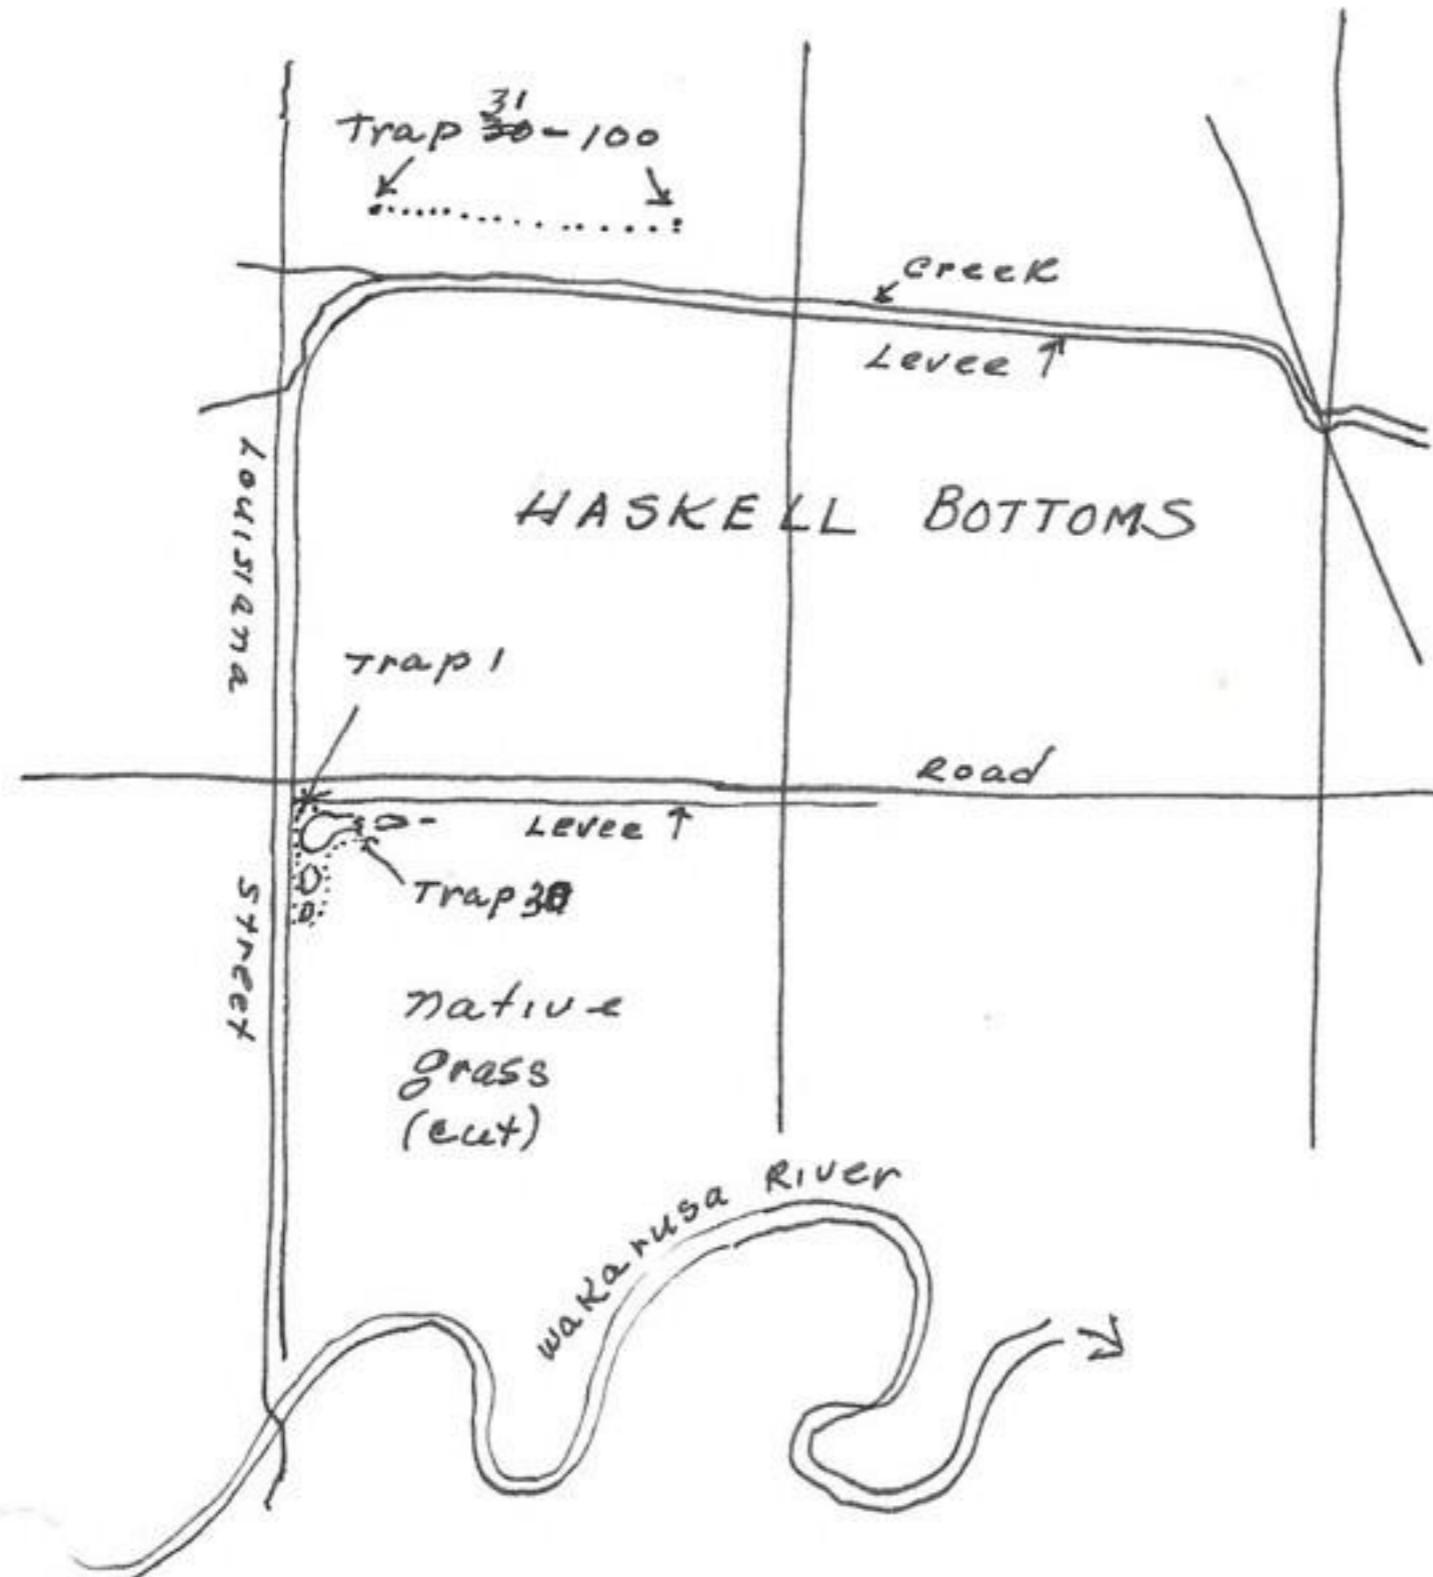

Crown rump	24 mm	25 mm	26 mm
total length	40 mm	42 mm	43 mm (standard length-nose-tiptail)
weight	2.3 gms	2.3 gms	2.4 gms

The male *Synaptomys* 621231-67, had large side glands, as observed on inside of skin.

The two specimens of *Synaptomys* were separated by 400 linear feet on dike. I was somewhat surprised at the small number of mammals taken from this trapline as I had considered the area to be excellent for small mammals, and particularly good for *Synaptomys* because of the permanent water. One explanation would be the heavy predation of snakes, especially copperheads, that inhabit the cliffs at the top of the slope. This area, although limited in extent has never been changed in the 15 years that I have checked the area. The levee at base of slope east of this area hold promise for good trapping and if the snow does not come I will give it a try.

3 9/10 mi. S and 7/20 mi. W Lawrence (P.O.), Douglas County, Kansas.

Dec 31, 1962

Set 30 traps around small permanent pond (sometimes it dries) and 2 segmented ponds to south but joining. Traps set 20 feet apart on slope of dike and at edge of pond bordering the field of native grass which has been cut and bailed. The trap line continues the line set Dec 30, 1962 and consists of high grasses and weeds with very little mat grass beneath.

The ground was mainly free of snow but some remained in protected places. At another place to the north beyond the levee

at exactly $2 \frac{19}{20}$ mi. S and $3 \frac{1}{10}$ mi. W Lawrence (P.O.) set traps 31 to 100 in a line directly to the east at 20 foot intervals. This field is homogeneous and of grasses which have not been disturbed for a year or so. There is considerable activity and trail making beneath the dense matted grasses but trails were exposed only when the grasses were removed overhead. Realizing this activity I placed all traps on top of matted grass and in situations not associated directly with a trail, although trails were directly beneath in some cases. The lack of microtus (only one) and Sigmodon and the predominance of Reithrodontomys and Peromyscus maniculatus indicate reluctance of microtus to leave their runways foraging areas.
