

2:42 5 juncos, crow, 2:45 crossing N. border section 20, 2 cardinals, flock <sup>gold finch</sup> ~~pink skin~~, red-bellied, cooper hawk. 2:47 drainage from N., 2:50 entering section 16, 2 ~~phoebes~~ <sup>phoebes</sup>, good beaver sign, 1 crow.

2:55 great horned owl, downy w, cardinal, good beaver activity.  
 3:00 junco, downy, reached bridge<sup>w.</sup> section 16 Left bridge 3:12 to pick up car to west. Checked deer at bridge. Arrived car 5:30 PM bridge at course 69.5. now to east. Lawrence 83.8 at 6:25 PM. On return trip by walking did not keep complete census as was done on course trip, because of other interests on the return trip. One of the areas supporting greatest number of birds was in area surrounding pond approx. 2.10 mi. SE Belvoir School in sec 17. The area in red at S border of sec 17 is a good habitat for meadow orhogaster and Synaptornis. The native grasses extend from edge of permanent creek which is fed by spring on upland to NW, to the top of the slope. Some good sign of Synaptornis. The two small springs in sec. 24 are devoid of vegetation because of cultivation. They may be dry in summer but ground is probably wet to damp. These damp areas have forced the farmers to extend roads beyond base of hill. Good native grasses on uplands to N.

Univ. Kansas, Douglas Co., Kansas  
 march 25, 1963

at about 10:00 A.M. noted 8 fox squirrels on ground in forested slope on campus. These squirrels were actively feeding on ground as individuals and groups of 2.

at 2:00 P.M. there were no squirrels on the ground. There were no other squirrels on the ground in the rest of the grove indicating a definite community development. A hundred or so students pass thru this grove in the course of a day.
