

age and longevity of this particular squirrel in the area at 1620  
Tennessee St, Lawrence, Kansas

Lawrence, Douglas Co., Kansas.  
March 15, 1965

at 1:15 P.M., in a clear sky and flying north across Lawrence at what would be equivalent to Louisiana St, and at approx. 1500 ft elevation, <sup>were</sup> 900 snow and blue geese. They called occasionally. This flock was composed of 8 incomplete V formations they were too high to actually differentiate between snows and blue but assumed that they were both represented. The last 2 days have been clear and temperature higher than normal. They continued north out of sight. at 4:15 another flock of approx 1800 flew north at the same altitude and at the same position in regard to Louisiana Street. Sky still clear and temp about 50°F. I do not know how many geese have passed by today. The 2 above observations were made <sup>put of doors</sup> on two occasions while walking to school and returning in the afternoon.

March 16, 1965

Clear skies and 70°F temperature changed at about noon as rain front moved in from the north. This front dropped rain in successive waves in the afternoon and in evening up to at least 9:00 P.M. rained continuously and substantially. Temperatures are expected to drop to 20°F. Thunder & lightning accompanied rains. Tornado in SE Kansas today.

March 26, 1965

One grackle flew into tree across street from 1620 Tennessee on the Maupin property. The pine trees have been used as nesting sites. It remained in one position for about 1 minute and moved its tail up and down as by reflex action. It then moved thru top of tree and remained on one branch for 8 minutes without body movement. Day 22°F and observation at 8:00 A.M.

1 mile S Williamsstown, Kansas

March 26, 1965

From the Lawrence Daily Journal World it was reported that 40,000 snow and blue geese (some Canada geese) took to the air
