south and within 1 foot of top of bank at residence at NE corner of bridge. Photo 650606-4 about 2/10 mi S of bridge on Highway 59 showing water covering floodplain and encroaching on fields on slope of valley. Considerable flooding of fields in this area from Wakarusa River. This flooding from the Wakarusa continued up valley along Clinton road to about Washington Creek bridge. At a point about 200 feet E of the N end of proposed Clinton Res. dam, the water had backed up creek that flows into Wakarusa at this point to $1\frac{3}{4}$ feet above the level of the bridge and road. The water, at its highest point was $3\frac{1}{2}$ feet higher than bridge.

At the point the Peterson road joins the main valley road on N side of Wakarusa Valley, noted 14 horned larks in one group, representing several families of the year.

Two redheaded woodpeckers at road that turn S to Clinton from Wakarusa Valley road S of Wakarusa River.

Wakarusa River, Douglas Co., Kansas

James Robert Bee & his 2 friends, Daniel and Albert Brune left Lawrence bridge at 6:40 A.M. and arrived Endora bridge N of the town at 10:20 A.M. having travelled approx ^{approx} $14\frac{1}{2}$ miles in 3 hours and 40 minutes or $\frac{1}{4}$ miles per hour. They picked up canoe (Fulps) that had capsized the previous day and had lodged in a log jam. Fulps canoe and 4 passengers had struck a limb, to which the canoe held on as canoe shipped water and finally pulled away from them and disappeared down current, filled with water but still buoyant because of 2 air chambers at each end of canoe. Paddles and thermos jug also lost. Water at time of trip (yesterday) was flooding over banks into fields. Two of Fulps passengers could not swim! At 6:40 A.M. water at Lawrence bridge approx 8 feet lower than flood level yesterday.

Lawrence, Douglas Co., Kansas
