day overcast and weather variable with winds in late morning to gusts. Later winds subside but always ripples. Wind from NE. Grackles along dam and only bird. They leave in middle of day  
graft of Sept. 23 superimposed

In comparison of this date and the census of June 29 in part of this area would say that there is a decided difference in feeding behavior. In the late afternoon of June 29 the day was hot and clear and the fish were not feeding whereas today the sky was clouded and cool with winds to create a water surface agitation that is protective for fish exposure.

Enroute to Perry Lake this morning recorded the kinds of bird: (Left 7:30, via road just n of turnpike, thence to LeCompton, Perry etc). meadowlark, Eng sparrow, starling, barn swallow, dickcissel, grackle, killdeer, redwing, mourning dove, cowbird, cardinal, bluejay, bobwhite, (Kansas River), indigo bunting, 780 mm Kingsnake. (Perry), mockingbird, (SE Perry Lake area) From here to E end dam - barn swallow, mourning dove, meadowlark, bobwhite, robin. In walking on top of dam from west end to gate noted 10 individual grackles either on rocks on slope or near water. They are most commonly seen in morning or late afternoon and are the only birds among the dam area on n side. Wave action from passing motor boats must be an important factor in fish feeding. One bullfrog (large) among rocks <sup>in water</sup> and calling and only one observed. Water among rocks not used by fish
