

excavated or the hole or den recently cleaned of its debris. Dens ~~are~~^{near} steep rock outcrops were on flatter slopes adjacent to the rocks but with trails leading to the rocks. One was heard but not observed among dense conifer-shrub mass without noticeable trails associated. It call from this ^{some} place (exact spot) on 3 different occasions I had to pass the area. The call is more squirrellike than marmotlike. The first note (1-3) is a sharp chirp followed by a series of ~~so~~ softer notes (5-8) given in a muttering voice. The call is in the form of the marmot call but sounds more like a Citellus call.

From an area from ocean beach to plateau above collected the following dominant lichens and mosses:

<u>720802-11</u>	720802-36
<u>720802-12</u>	720802-37
<u>720802-13</u>	720802-38

In the interest of conservation I would suggest that cars and trucks not be driven on the tundra; that excavations for roads ^{material} not be made on ridges ^{but} adjacent to the roads; that refuse be placed in a land fill; that prevailing trash be cleaned from tundra. There has been severe violation of the above, especially wholesale distribution of junk and refuse. It has developed from generally dumping on tundra ridges to concentrated dump over cliff. Polluting the land & ocean is still practiced in this part of Labrador.
