

made count of 4 classes of geese in flock mainly from edge of flock where geese 3 or 4 deep and he counted with reliability. These classes are adult snow, young snow, adult blue, young blue. It can be shown statistically: percentage snows to blues, young to adults, separation or random arrangement snows to blues, etc. S = adult^{snow}; s = young^{snow}; B = blue adult; b = young blue.

The first census is between adults and young of two forms combined.

 (at this time at 9:50 the flock left and drifted 200' to E as result of a car^{on} dam that honked its horn and straggled its wheels on the macadem. There has been several instances of cars stopping & honking horns without geese leaving the surface. The geese however, always reacts by changing direction of movement on the water. At this time 15 mallards remained in the area occupied by the geese indicating infiltration of mallard into the flock of geese). Will continue on with census: s S S S A S S S t S S t B A
