24. (678 J.B) Immature Neotoma l. monstabilis. at back of cave.

25. not visited

26. not visited.

George set along top of accumulation across cave front and reports 5 Peromyscus only. Was quite surprise at last net catch, but that frequently happens and one must be cautious in assuming the degree of activity of likely areas unless substantiated by returns from a trap line of some area.

Collected Sayornis saya saya in front of cave (679 J.B) and was flying along the side of cliff inspecting the honey combed pocket. On returning to camp collected a Spizella m.

fallax (680 J.B) at junction of Sulphur and Fremont feeding at edge of creek at base of willow and Cottonwood.
