

approx 1 1/2 hrs before sundown. 16 mule deer feed on mountainside in groups of 5-5-3-2-1. One group of 5 were first observed approx 1/2 way up slope. They made rapid progress to base of mountain and fed on herbs along fire road. A hiker + 2 dogs arrived and the 5 deer moved up mt slope to about original position when first observed. The other 4 groups reacted to the hiker + 2 dogs. 4 motorcycles, 2 joggers, 1 other hiker and 1 car all produced a running escape of the deer on the mt. slope.

At sundown noted the green flash for first time. It was associated with extensive red (prolonged) sky.

after the sun disappeared out of sight. After the sun dropped behind the mt the sky directly above in an area 4 x width of sun and 2 diameters above

this greenish area was not a flash but gradually appeared & left to reddish field after 26 seconds. Photo 841118-1 of sunset after green lights had disappeared.

It is interesting that after red leaves the field of vision, the afterimage is green which is the complementary color of red and may be confused with the green spectrum zone or green flash.

Nov. 18, 1984

visited Louise (Celbertson) Colton at 5455, 1250 E, 785-2214, Pleasant Grove. She is to check with Pat's wife for genealogy book of the Celbertson family.

Nov 19, 1984

Dr. Donald Forsyth took Annette & me to lunch and then to Anthropology museum, 1 E, 7th N. The collection was being catalogued and prepared for the computer. One of Forsyth's associates, Ted Muffin (Bee family) Bot 653, Provo, Utah, 84603 801-374-1210. Bob Bee will check with Muffin for information on the Scotch-Irish-English Bees

Nov. 20, 1984

Had appointment with Dr. David Alfred Director Bern. Sci. Museum
