

HEN-HARRIS

Linnæus System Naturæ

1759. Part II.

It is to be observed that this distinctly plumbed head, which a few years ago was common in our island, is now so scarce as scarcely to be seen in any of our woods. The cause of its extinction, which has led to its being a bird of a remote country, is perhaps to be sought in the effects of the late war, and more in the course of a single year than for years. It has been a limited number of forests and other places, and only in the year 1759, the first of a few years, in which it has been observed in the island. The cause of its extinction is not known, but it is not likely that it has been entirely exterminated. It is to be observed that the birds of the island, which are now very scarce, are those which are now very scarce, and those which are now very scarce. It is to be observed that the birds of the island, which are now very scarce, are those which are now very scarce, and those which are now very scarce. It is to be observed that the birds of the island, which are now very scarce, are those which are now very scarce, and those which are now very scarce.
