

60.

on the feathers of the fore-neck, breast, sides of body, and under tail-coverts. Total length 12 inches, culmen 1·4, wing 6·8, tail 6·3, tarsus 1·6.

The young males at first resemble the females and have the bars on the breast. As Messrs. Salvin and Godman have pointed out in their original description, the procedure of moulting into the adult plumage varies in different individuals, sometimes the green throat being assumed while the flank-plumes and other ornamental feathers have scarcely begun to develop.

The Plate represents an adult male and female, drawn from the type specimens in the National Collection.
