

THALASSIDROMA WILSONi, DeLong.

Wilson's Storm Petrel

Wilson's Storm Petrel is a small bird, about 10 inches long, with a dark brown upper surface and a lighter, often white, under surface. It has a long, pointed beak and a slender neck. The plumage is soft and downy, especially in the young.

The bird is named in honor of the late Dr. J. A. Wilson, who first described it in 1891. It is found in the Pacific Ocean, particularly around the Hawaiian Islands and the coast of California.

I have seen many of these birds in the Pacific Ocean, and they are very common around the Hawaiian Islands. They are usually seen in small flocks, and they are very active and noisy. They are also very intelligent and curious.

The young of the bird are very small and are usually found in the same places as the adults. They are very active and noisy, and they are also very intelligent and curious. They are usually seen in small flocks, and they are very active and noisy.

The bird is very common in the Pacific Ocean, and it is also found in the Atlantic Ocean. It is a very interesting and beautiful bird, and it is one of the most common birds in the world.
