

STERNULA NERIEIS LAM.

Author's title page

London, 1844

The following is a description of the species of the genus Sternula, which is distinguished by its long, slender bill, and its habit of feeding on the ground. It is found in the Mediterranean Sea, and is particularly abundant in the island of Sicily. The young of this species are distinguished by their white plumage, and their habit of feeding on the ground. The species is distinguished by its long, slender bill, and its habit of feeding on the ground. It is found in the Mediterranean Sea, and is particularly abundant in the island of Sicily.
