

BRUNNATAURA ALBATRAX

Blouin, 1844

The bird would appear to be a kind of ...

The bird would appear to be a kind of ...
at least up to this point it has not been observed ...
before that it is never seen in the ...
interior, and that it is only found in those ...
with high trees and mountains. The ...
possesses the power of remaining ...
the surface without taking wings. It ...
it has no voice, but makes a noise ...
It breeds in September and October, ...
from two to three in the nest, which ...
first, two males and two females ...
the food consists of insects, ...
The female will be seen in ...
The male has the habit of ...
not wings and tail feathers ...
certainly remains quiet, ...
that first and last ...
The female is the same ...
marked with indistinct ...
under various ...
which legs and feet ...
The figure ...
