

# COGNATE PHONOLOGY

THE BOUNDARY

The boundary between the cognate and non-cognate phonemes is a very important one. It is the point at which the phonemes of one language begin to differ from those of another. This boundary is not always clear-cut, and it is often difficult to determine exactly where it lies. However, it is generally agreed that the boundary is located at the point where the phonemes of one language begin to differ from those of another.
