

ODONTOPHORUS LINCOLNIAE

Superficial Fungus

George H. R. Saccardo

On the superficial fungus, *Odontophorus Lincolniae*, which attacks the leaves of the *Lincolnia* plant.

The fungus, *Odontophorus Lincolniae*, was discovered by me on the leaves of the *Lincolnia* plant, which is a native of the United States. It is a superficial fungus, and is characterized by the formation of small, white, powdery masses on the surface of the leaves. These masses are composed of numerous small, spherical spores, which are arranged in a regular, hexagonal pattern. The spores are very small, and are easily dispersed by the wind. The fungus is very common, and is found on the leaves of the *Lincolnia* plant in all parts of the United States. It is a very common pest, and is very destructive to the plant. It is very difficult to eradicate, and it is very common to find the leaves of the *Lincolnia* plant covered with the fungus. The fungus is very common, and is found on the leaves of the *Lincolnia* plant in all parts of the United States. It is a very common pest, and is very destructive to the plant. It is very difficult to eradicate, and it is very common to find the leaves of the *Lincolnia* plant covered with the fungus.

Odontophorus Lincolniae Sacc.

(*Lincolnia* Sacc.)

Found on the leaves of the *Lincolnia* plant.
