

BOHRADIA ALBIDIA

Yucca borealis

This species is native to the mountains of the Sierra Nevada, California, and is characterized by its very large, rounded, bulbous stem and its many upright, sword-shaped leaves. The leaves are thick and fleshy, with a distinct midrib and a serrated margin. The inflorescence is a tall, branched panicle that bears numerous small, bell-shaped flowers. The plant is very hardy and can survive in a wide range of climates, from the cool, moist mountains to the hot, dry deserts.

The plant is very hardy and can survive in a wide range of climates, from the cool, moist mountains to the hot, dry deserts. It is a very common plant in the mountains of California and is often found in large numbers. The plant is very hardy and can survive in a wide range of climates, from the cool, moist mountains to the hot, dry deserts.
