

ODONTOPHORUS COLUMBIANUS, Gould

—Eugene P. Smith

—Eugene P. Smith

The following is a description of the species, based on the original description by Gould, and the material examined by the author.

The species is characterized by its large size, and its distinctive markings. The head is large and broad, with a prominent snout. The body is elongated and tapers towards the tail. The wings are large and powerful, with a distinct venation. The tail is long and deeply forked. The coloration is primarily brown and black, with a prominent white band across the middle of the body. The markings on the wings are also distinctive, with a large white patch on the upper wing and a smaller one on the lower wing. The tail is also marked with a white band. The species is found in the mountains of Colombia, and is particularly common in the region of the Cauca River.

The species is a member of the genus *Odontophorus*, and is closely related to *Odontophorus columbianus*. It is a very common species, and is often seen in the mountains of Colombia. The species is a member of the family *Phasianidae*, and is a member of the subfamily *Odontophorinae*. It is a very common species, and is often seen in the mountains of Colombia.
