

ANDIGE

*And. rostro ad basin cocc
subtus cinereo-cyaneo.*

Crown of the head and ba
brownish black ; rump
slaty grey, four central
on either flank a large
blood-red ; culmen an
the upper mandible a
side of the upper m
coloured plate or lam
and detached in front
of the mandible below
Total length, 18 inches

Andigena laminirostris,

For our knowledge of this
who discovered it in the fores
that country. At the time
single specimen had been s
Philadelphia, was kindly len
describing. Since that time
collection.

It is certainly one of the
feature in its laminated bill n
unknown to us, and we are e
the other members of the f
be the females ; if so, they h
The figures are of the natu
