

RAMPHASTOS ERYTHROBRYCHUS

Herbert J. Turner

1910

Many forms of this genus have been described, but the present form is distinguished by its peculiar coloration and its habit of living in the water.

The present species is distinguished from the others by its habit of living in the water and its peculiar coloration. It is a very common form in the water and is found in many places.

The present species is distinguished from the others by its habit of living in the water and its peculiar coloration.
