Dr. F. C. Allen  
Director of Physical Education  
University of Kansas

Dear Dr. Allen;

In regard to the x-ray of the dead tooth of Robert Allen, Dr. Tice suggested that the tooth should be observed at frequent intervals, because there was a suspicion of apical involvement. I believe that it might be wise to let this go until he is through basket ball because the end result will have to be a bridge, and it would be unwise to put in a bridge now with the possibility of breaking it during active participation.

In checking over some intramural records I notice that Carl Johnson was on the list for one of the intramural touch football teams. A year ago at the time we examined him for basketball, You may recall that I reported that he had a retinitis of one eye. We had no record nor did Dr. Powell have a record, of his having had any treatment. I believe that this is something that should receive attention within the near future. I do not believe that anyone should participate with such a serious injury.

Yours truly,

  
Ralph I. Canuteson, M. D.
