

Nearly half of the health instruction (49.1 percent) is being handled in the physical education departments of schools indicating a requirement. Schools of education and health education followed in that order of departments offering the course.

Schools of education are leading in making health education a requirement. In 56.3 percent of the cases this is true. State departments of education is the next most important agency with 32.7 percent. Physical education departments are responsible in 3.6 percent of the cases. The curriculum committee initiated the course in one case. One of the college presidents was responsible for the requirement in one school.

The evaluation of objectives was the least satisfactory of the entire study. Two different people rated the objectives in one school. Strangely enough the dean of the school gave the objectives a higher rating than the other person who was directly interested in teaching the subject.

There seemed to be no relationship between the length of the course and the realization of objectives. There seemed to be no significant relationship between the length of time the course had been required and the realization of objectives.

In a geographical comparison in the study it seems that the West is leading the East both in interest in the problem and in doing something about it.
