

An "ounce of prevention is worth a pound of cure." It is better to safeguard against icy pavements than to necessitate treatment for broken arms and legs afterwards.

There are several problems on this campus which don't seem important, but which in reality are. One of them is the poor sewage system that occurs on our streets. After a heavy rain large amounts of water collect in the gutters and in the streets. We all know that wet feet is a direct cause of colds and flue. Now, if we could improve the efficiency of the drainage facilities which would enable all of this germ-bearing water to be removed from the streets, I believe we would find that our health program could improve a large per cent.
