

In the middle of the season there was some question about the number of violations. It seemed that the number of violations was too low and it was the opinion that our observers were missing a few violations. Without discussing the matter with the observers, a check was made during the game with Team F and both sets of observers had nine violations on the Kansas team charged against the same boys. We realize the data cannot be more accurate than our observers and this check on the violations indicate that our boys were noticing the game rather closely.

Table IV shows the player analysis for twelve players. A few more players were used in the home contests, but all had less than 20 minutes of playing time to their credit and were not included in the present table. The number (see Table IV) preceding the dash in the various columns represents the individual's rank in relation to the other members of the squad.

The scoring ability index as shown in column 2 is based upon goals and free throws made and is computed as shown in the first study under definition of terms. If two boys each made 25 goals, the one with the highest percentage of made shots will have the highest scoring ability index.

By changing the order of some of the data it is possible to make some player comparison between the two seasons play on the same basis.

Player	1937-38 season		1938-39 season	
	Offensive efficiency	Ball handling error	Offensive efficiency	Ball handling error
A	90.5	4.6%	95.7	1.4%
B	96.4	1.7	97.9	.5
F	92.2	2.9	97.2	1.1
I	94.1	2.0	76.4	2.4
L	94.3	2.4	97.6	1.5

This rating shows that all the players, with the exception of Player I who did not finish the season, did make improvement.
